I can't believe that anyone would go to a *.advocacy group and look for
mature posts! This person is obviously new to Usenet. :) :) :)

(And yes, I admit that I own an Atari; personally, I prefer to use a specific
brand because of its merit, not because other people made me want to own it.)

Oh c'mon, Crystal, get a life, will ya? One of the main reasons this comp.sys.atari.advocacy group was started was because of the countless immature posts by Amiga users in the comp.sys.atari.st newsgroup!

The whole purpose of an "advocacy" newsgroup is to let your feelings roll. I wouldn't spend a lot of my time searching for so-called mature posts in comp.sys.amiga.advocacy so don't expect any difference here.

And what in the world makes you think anyone here CARES about trying to convert you from an Amiga to an Atari system? Enjoy what you have. Be happy.

>here in the US?

According to an article last month in the, I believe, Wall Street Journal;
most of the IBM and compatible vendors didn't enter the UK, etc. markets
because they felt most people couldn't afford what they had to offer.
This left the market wide open for the cheaper priced Atari and
Commodore.

>sort.

Well, convince me how this is true. I have a 400, 2 800XLs, and a 130XE,
two drives, etc. etc., so I used to love my Atari. I used to defend
it to the utmost against my dad's IBM, etc., telling him how he should
convince his company to buy the "new" 520's, etc.... But now I
have an IBM compatible. A very fast IBM compatible. And a Soundblaster
and a Turtle Beach sound card as well, with the Proteus chips. I
would now like to ask you how you can say that a 1040stfm will
drive circles around my setup. Just exactly what _are_ the sound
capabilities of the 1040stfm? I find your price a little hard to
believe with monitor, but if it's true, I could have bought _2_
1040's for the price of my soundcard....:)

From: bjgrier@bnr.ca
Message-ID: <C5HH32.1u5@news.rich.bnr.ca>
Source record: 23241

1) My ST shall remain to play games (OK I only use it for Falcon)

2) My TT shall remain to experiment with, and become a better programmer. :)

3) My wife may not remain if she keeps harrassing me about 1 and/or 2

Just kidding Maureen.

I own a clone, it sits in a closet. Paid more for the clone than the
ST and TT combined. (Since Maureen knows what the ST and TT cost I am
now in serious trouble) I had this terrible urge to "UPGRADE" to the
latest technology a couple years ago, and paid a terribly high price, for
something I hated, and now can not sell for half price.

## 8. What ATARI stands for.

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-14 17:28:21 UTC
From: vl2609@albnyvms.bitnet
Message-ID: <1993Apr14.172821.3260@sarah.albany.edu>
Source record: 23243

I have been seriously wondering as to what ATARI stands for. I have heard the Japanese meanings of the word (i.e. "Mark" or "Hit" in the game Go) But I remember there being another meaning to it as far as an acronym goes. If anyone out there knows what that meaning is please E-mail it to me.

A: No. I don't remember the rest of his post, but no they don't make
much of an impression to me. But, surely, you've felt the same
way about your fellow Amiga owners? I don't think the percentage
of embarasing Atari owners is any greater than embarassing Amiga
owners. And, the Atari people tend to stick to their own bases
more! (I do read skim the Amiga bases...)

I actually think those posts were exuberance of the base appearing
rather than any real indication of the level of discourse that will
be found here. I don't think anyone has the first 50 posts to
Amiga advocacy around to compare them to.

>chip set.

Certainly.. but there is a flip side.. Anyone who owns anything from
Atari greater than the 800.. doesn't own an "Atari". They own a
nondescript piece of crap released to compete with the "real" Atari
machine. :-)

> Stats on the latest release: the atari Falcon, are just about everywhere.

## 13. Re: Atari Popularity in Europe

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-14 20:16:41 UTC
From: robert@cpuserver.acsc.com
Message-ID: <1qhrf9$6vs@acsc.com>
Source record: 23247

I seem to remember Atari ST's being flogged in Britain as
cheap Macintoshes - they were about a quarter of the
price, with similar technology (or so it seemed! :-))

Most American computer companies used to do a 1 for 1
pricing scheme i.e. 1 dollar = 1 pound, so something
that cost $300 would cost #300, not #150-#180 which
it would do if the exchange rates were followed.

I also remember that there was a major trade in 'gray'
Macintoshes for quite a few years. These were US Macintoshes
shipped to Europe independently of Apple (therefore voiding
all warranties) and sold for half the price of Apple. Apple
finally corrected this about three+ years ago by dropping their
prices to roughly what they should be (probably a bit more
scalping going on :-)) - because the amount of money people
were saving more than made up for the risk of no warranty!

Nothing like that went on with Atari :-) :-)

Robert.

You know, folks... (s)he's right! I mean, do you ever see stuff like that
on amiga.advocacy??? Naaahhhhhh... oh, and for someone who talks about
performance specs being the ultimate authority of a computer's viability, isn't
it odd that Atari would be ruled out on the basis of 3 posts to c.s.atari.a??

can we say.... hypocrite?

>wrong?

Yeah, it is important to categorize things as much as possible. First
we have PEOPLE. Then there are computer using people, which I will
designate as GEEKS. Then we have Atari users, who I'll dub FANATIC
GEEKS. So now all we need are liberal Atari users (FANATIC COMMIE PINKO
GEEKS) and conservative Atari Users (FANATIC RIGHT-WING REACTIONARY
GEEKS) to round out the picture.

Ah, but why stop there? We can have younger Atari users (PIMPLE FACED
GEEKS WHO COULDN'T BUY A DATE BUT WOULDN'T TRY ANYWAY 'CAUSE IT WOULD
RIP THEM AWAY FROM THEIR ATARIS), older Atari users (GERITOL SUCKING
GEEKS WITH WALKERS), gamers (NOT REALLY A GEEK BUT CAN KICK SOME SERIOUS
ALIEN BUG BUTT), artists (PIXEL? WHAT'S A PIXEL?), hackers (GEEKS WHO'S
MAIN GOAL IN LIFE IS TO BREAK INTO THE HUSTLER MAGAZINE MAIL ORDER
SYSTEM) and telecom junkies (GEEKS WHO WOULD RATHER TYPE THAN TALK).

Say, it IS nice to have a place to lord over you Atari owners about my new Amiga 1200!
But seriously, I have been an Atari user in the past. Some of my best friends use Ataris. I have been with Amiga since '89 and will never leave. However, I have a couple of questions for you Atari experts out there.
1)what exactly is this 'true color' mode I see on Falcon specs?
not real 24 bit(NFP, we don't have it built in either)I assume or it would be touted as such.

2)and: My friend I mentioned earlier needs a term proggy which can dwnld Zmodem. He has a cool modular program but no Zmodem. Thus, he cannot get stuff off the net. If someone can point me to a good one, I can get it for him and put it on IBM 3.5 floppy.

Thanks!
(And hey, we can both thank Bog for the European market)
anyhoo.

I can't believe that your dad convinced his company to purchase IBMs in the first place; I mean, it's such a game machine. All the latest games are released on IBMs first now. Heck, I myself can't go into work without seeing Castle Wolfenstein 3D, Ultima Underworld, or some other time-wasting activity going on. It's almost enough to make you want to replace all their machines with STs running Minix, just so that they'll get something done... ;)

John

(Actually, I have seen people running Wolf 3D and Ultima Underworld at work.)

BZZZT! Sorry, thiank you for playing.

Atari fas founded in the early 70's by Californian entrepenuer Nolan Bushnell, who sold it to Warner Brothers sometime around 1980 (plus or minus two years; I don't remember). He named it after the Japanese word "atari" which is used in the Chinese game Go to let your opponent know that one of his pieces is about to be taken (ala "check" in chess, but not quite). Warner sold the millions-losing Atari of the mid-80s to Jack Tramiel, a canadian-born (I think) businessman. During all of this time, Atari has been located in Sunnyvale, CA. Like most American electronics companies, the have most of their manufacturing in the far East. Had Bushnell been able to predict the attitude of Americans toward Janpanese trade, he's probably have called it something like Bushnelectrics or something.

Aren't all computers just toys ("Game machines") now? :-) :-) Just
look at what some people are doing to their machines now. Application?
yes. But primary applications? Not a chance! I know people with IBM
PeeCees, Suns, Silicon Graphics, Next, Commodore, Commodore-Amiga, Apple,
Apple-Macs, TIs, blah blah blah.. and I know that most just use them
for games. BTW, you should try out the F-16 game for Silison Graphics.
It is great! I crashed, but I loved it. So much for this.

No, you are wrong. Although the name is asian sounding, the company was
founded and owned by AMERICANS (it shouldn't make a damn differernce unless
you are racist). There was an interresting article by ANTIC magazine
that told of the history of Atari.

>Uhhhh....ATARI is a Japanese company.

Ummm, first of all ATARI is a Japanese word; it is (one of the) winning moves in the Chinese game of GO. The logo for ATARI is the FUJI symbol which is a Japanese character that resembles the revered Mount Fuji.

ATARI is sorta like the English word CHECKMATE ie `I WIN!'

I imagine Nolan Bushnell, the founder of ATARI, played GO at the time, and also wanted a Japanese sounding name, as the Japanese were making a good reputation for making electronics; I wouldn't be surprised that Nolan also figured it would help in selling machines -to- Japan.

ATARI is, and always has been, an AMERICAN owned company; as far as I know, Warner Bros. (who owned ATARI at one time) still owns a small piece of ATARI; I don't know who (if anyone) owns Warner Bros.

The succession of ATARI was BUSHNELL to Warner Bros. to TRAMIEL.

Jack Tramiel (off and on CEO/President) was formerly with one of those other computer companies (starts with a C); he and his sons currently own (with some other shareholders) and run ATARI.

ATARI also owns several other companies; there is also another company named Atari (Atari Entertainment???) that makes the arcade machines, and has NOTHING to do with ATARI Computers et al.

> was up.

Sente was the name of one of the Bushnell companies (but not the next one after Atari). A move with sente is much more like a "check" in chess. A move with sente is one in which is powerful enough that a response is required. Atari just means a capture is eminent, it doesn't mean that the capture is important. The fact that "atari" is announced is what makes it seem to be similar to "check".

ATARI is an american company. It was founded by Nolan Bushnell and is
currently majority owned by the Tramiel family. The stock trades on
the Amex (located in Chicago.)
The name means hit, being derived from the Japanese verb Ataru.
Nolan Bushnell derived the name from its use in Go, where it is
similar to Check in chess.

## 41. Re: What ATARI stands for.

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-16 00:09:52 UTC
From: ekrimen@netcom.com
Message-ID: <ekrimenC5Jv4G.7z5@netcom.com>
Source record: 23272

From Fall 1989,

In BITnet, someone posted a message concerning the meaning of
"Atari." Here is the first and some replies.

---
A trivium from this month's "ST World":

"The word 'Atari' is shouted in the ancient oriental game called
'Go' to indicate victory."

Just think of all the other possibilities that they must have
rejected before picking this one.
---
That's an old story, and not even complete. The whole story goes
like this:

Nolan Bushnell, founder of the _original_ Atari (you know,
before Warner and Jack and the Sears Tele-games system), needed a
name for his new company. He wanted something exotic and unique,
and tossed out lots of ideas even wilder than Atari. He
eventually fell on the word "Atari" because of the Japanese game
of Go. In Go, the player says "Atari" when he is in a position to
almost completely conquer his opponent; the Western analogy is
"check" in chess.

It gets stranger. If you will recall, Nolan Bushnell started up
a new arcade game company about 5 years ago, called Sente (now
part of Bally games, guess it didn't do so hot B-). What does
"Sente" mean? "Checkmate".

[parts from the previous message]

Ya gotta admit, that Fuji logo looks neat. (The most popular
rumor is that the logo is a stylized "A", with some symbolism for
the game of Pong)

[if anyone can explain that Pong thing, please. What symbolism?]
---
The meaning of Atari in go is like check in in chess: you threaten
to conquer one or more stones and you warn your opponent that you
are doing this. This may or may not be vital (unlike in chess).
The meaning of the word sente is different from what the previous
poster said. Sente means the right to move first. If somebody
comes out of a local fight in sente he is the one who is at
liberty to choose the next confrontation. This can be a big
advantage. It can determine whether you are on the offense or on

the defense (gote).

So atari tried to put some companies in 'atari' (did capture one company but that wasn't a good move after all).

## 42. Falcon deliveries

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-16 00:33:36 UTC
From: jeffw@ficus.cs.ucla.edu
Message-ID: <jeffw.734920416@ficus.cs.ucla.edu>
Source record: 23274

My dad sent me this today:

It was reported by Atari on Monday on GEnie that the Falcons arrived in
the USA on Monday and were going through Customs. They expected to
receive them in Sunnyvale Tuesday and to check them for quality
control and start shiping them out immediately. They didn't say how
many were in the shipment. Atari's stock was listed in the Chronicle
this morning at 7/8.

Any other news?

Alright, forgiven, but I STILL DON'T KNOW WHAT ATARI STANDS FOR. I realize that the word has meanings but according to AP press it has an acronym. Its in the abbreviations guide but it doesn't say what it stands for only that it is related to the Atari corp. Please please help me,
IM GOING MAAAD!

>From Fall 1989,
>In BITnet, someone posted a message concerning the meaning of
>"Atari." Here is the first and some replies.
>
>He
>eventually fell on the word "Atari" because of the Japanese game
>of Go. In Go, the player says "Atari" when he is in a position to
>almost completely conquer his opponent; the Western analogy is
>"check" in chess.

Jeez, I expected lots of misinformation here, but not about the name of the company!

Anyway, "atari" is indeed a term from Go, but it doesn't have this meaning at all. The word atari refers to a *state*. A piece or group of pieces is "in atari" if it has only one liberty; i.e., if the placement of a single stone by the opponent could capture the group.

Someone mentioned that you shout atari when you're about to win. That's like someone telling a Go enthusiast that in chess you club your opponent with a stick when he's about to win.

You don't *shout* anything while playing Go. Under normal circumstances it is an incredibly sedate game. Nearly comatose at times. :)

And you only say "atari" (*quietly*) if you're playing against a complete novice. No decent player would ever miss an atari, so saying "atari" is sort of insulting.

Finally, atari's happen all the time. They're an integral part of the game play. The analogy to chess would be more like announcing to a novice that you're able to take some piece (any piece).

> It gets stranger. If you will recall, Nolan Bushnell started up
>a new arcade game company about 5 years ago, called Sente (now
>part of Bally games, guess it didn't do so hot B-). What does
>"Sente" mean? "Checkmate".

This is even more silly than the last claim. "Sente" is a move that keeps the initiative by forcing a response from the opponent. A possible analogy to chess would be moving a pawn forward, thereby forcing the opponent to move his queen or lose it. I.e., the key thing is that the opponent has the option of doing nothing, but taking that option would be incredibly stupid. So you effectely take away the opponent's choice about his next move.

The second message you quoted is closer to reality.

People who are really curious should get a book on Go. Ishi press has lots of them. An excellent introduction that defines such terms is "Go For Beginners" by Kaoru Iwamoto. This book has also been published by Pantheon books, so you should be able to order it through the usual channels.

There's also a newsgroup devoted to Go: rec.games.go.

96aander@ultrix.uor.edu (3) writes:

> 1)what exactly is this 'true color' mode I see on Falcon specs?

It is 65536 colours - 1 word per pixel, no colour look-up table. The bits in the word map as:

RRRRRGGGGGGBBBBB

ie. 32 intensities of red, 64 intensities of green, 32 intensities of blue.

This gives excellent displays for real-world images, and less than perfect (but almost) for computer generated images such as shaded red spheres (but even 24-bit has trouble rendering those at times).

There is a variant mode which is 32768 colours, which is 32 intensities for each of red, green, and blue, plus one bit for overlays (used by genlock, etc.)

> 2)and: My friend I mentioned earlier needs a term proggy which
>can dwnld Zmodem. He has a cool modular program but no Zmodem. Thus, he

From: squish@endor.uucp
Message-ID: <1993Apr16.073649.29184@das.harvard.edu>
Source record: 23284

As a veteran of several Atari products, I am happy to have owned them (most of them still work, one broke, when I zapped it inadvertently), which includes two 800's and two 130xe's (since 1982 or 1983), I was very happy to grow up on Atari 8-bitters and learned programming and hardware very well on them.... I am now an Electrical Engineer. And back then, I repaired Apple 8-bits at the high school (my first job, during high school). Oh, yes, we have several older Atari 800 products we no longer use, such as 800, 300 bps acoustic modem, peripheral port adapter, and 810 drives. Maybe someone would like to buy them???

However, I wish I could go back and change a few things on the original design. Cheifly, the serial peripheral port. Though 19.2 Kbps was FAST for those days, it just doesn't compare to the Apple IIe's parallel port drives. During high school, I got the chance to interface a robot (for a contest) through the POKEY PIA chips (a parallel interface), but I found the darn POKEY chip just too slow to handle the task (also to be blamed on the software I wrote). In all, I can see that the Atari engineers wanted something new, simple, versatile, and easy to connect, but time has worn this point down. Good thing back then, little old and confining right now... It makes getting data in and old just ridiculously slow.

Rather than grip about this, I would like to raise the question to users out there about their experience with MIO board hard drive interfaces that plug directly into the old 800 or the 130xe expansion slot. I was also wondering if anyone had built the SIO2PC interface that allows one to use a slave IBM-PC as a file storage device (much like a hard drive). I'd like to hear your opinions and comments. I was hoping to try and test a Macintosh version, but have been bogged down with work (no time to write the software... I'm still a novice Mac programmer... Don't know OOP too well.... Just Comp Sci basics for TEXT only interfaces... As in mostly mathematical programming). Lastly, are there still makers of the MIO hard drive interface board... I also wound up with hundreds of old 5.25" disks floating around, and I'd love to have that system running for my dad, using either the Mac as a file server, or a dedicated hard drive.

By the way, I do have to protest, and say the Atari is a great computer, but it just is a little out-dated for engineering purposes. I use two macs (one laptop, one at home). And at the lab, I use 486-66MHz PC's, Sun Sparcs, and Mac Quadras. Circuit simulation, Printed Circuit Autorouting, and CAD/CAM things just wallop raw processing power. A 6502 or 68000 just will no longer do. That's why you often see them as dedicated micro-controllers or things like laser printer

micro-controllers. However, they are handy CPU's to have around, and (after years of experience), easy to (Assembly) program.

Please, no flames, just adding my $0.02 worth, and trying to find out info about FASTER hard drive/parallel port use (my chief sticky point).

>wondering what the hell a Falcon is.

At the bottom of this article are the specs for the Falcon. The specs
are from the end of last summer but apparently haven't changed since then.

First, here are 2 comments lifted from the Atari sponsored music conference on
GEnie wednesday night.

---

Tonight, we want to talk with you about Atari Music, and the Atari
Falcon030 specifically. The Atari Falcon030 is more than a
computer, it is a musical instrument. EQ Magazine recently awarded
the Atari Falcon030 it's coveted "Blue Ribbon" Award - the only
personal computer recognized by the award winning magazine as an
important new contender in the pro music and recording industries.
By blending CD quality audio, digital signal processing, video
genlock, video overlay and MIDI, the Atari Falcon030 puts
recording and video studio capabilities directly in the hands of
pro and amateur musicians. You can't find these capabilities for
this price anywhere else, proving that sometimes you have to spend
a little less to get a lot more.

Music is about self-expression. Music video and computer
assistance are tools that allow for greater expressiveness, and
the Atari Falcon030 is the one computer that can help today's
musician master both these media to create revolutionary artistic
statements.

The Atari Falcon030 offers users "Quad Processing Power"!!! The
Falcon030's exceptional performance comes from the smooth
integration of four processors:

Motorola 68030 microprocessor running at 16Mhz
Motorola 56001 DSP chip running at 32 MHz
SDMA sound coprocessor
BLiTTER(tm) co-processor for extraordinary graphics capabilities

These function in a Direct Memory Access (DMA) environment using a
multi-tasking operating system, which results in hardware so
powerful that even inexperienced users can mix audio, video,
animation, text, and graphics right out of the box. Atari has a
long-standing relationship with the music industry. In the mid-

80s, Atari was the first computer company to market to musicians at the National Association of Music Merchants (NAMM) convention and to distribute through music stores. Part of Atari's rapid acceptance was due the inclusion of MIDI ports (another Atari first), and part was Atari's "Power without the Price" philosophy. This same philosophy has culminated in the Atari Falcon030, which delivers exceptional audio and video as well as music performance.

The Atari Falcon030 ships with stereo CD quality digital audio out of the box. The system is capable of eight independent sixteen bit audio tracks. At this point in development, there are four track systems available from third party developers, such as D2D Systems Ltd. 4T/FX. Innovative products are also on the way from Barefoot Software, EMAGIC, Steinberg, Dr. T's, and many other developers. If you would like to have a complete software listing of Atari Music developers, send James email here on GEnie at JAMES-GRUNKE.

---

<BOB-BRODIE> Pat, as I indicated on Monday night, the Falcons are here. We have them in the warehouse (I personally went over to check.... I didn't want to take anyone's word on this!!!) They will be going thru a Quality Assurance process that will take a couple of days (one of which is elapsed already), so I think we will be sending them out the door on Friday. These are the demo units for our dealers, and the next shipment will be in about 2-3 weeks These dates are VERY firm, Pat. I'm very pleased that the units are in stock FINALLY, and the dealer agreements have been just POURING in since we made a little announcement in AEO, got the reps on the phone, and of course, used GEnie on Monday night to tell the world that the Falcons are truly here!!!

---

Here are the Specs (These words are from Sam Tramiel (Atari big-wig (VP?))):

---

Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz

32-bit Bus

Optional 68881 or 68882 FPU

RAM: 1,4, or 14 megs

Standard Atari Cartridge Port

Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors

True color 16 bit mode allowing a display of up to 65,536 colors

Accepts external video sync signal to allow high quality genlocking

Overlay mode for easy video titling and special effects

Overscan on TV's and ST Color monitors

262,144 possible colors

hardware-assisted horizontal fine scrolling

BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels

Stereo 16 bit digital DMA input

Stereo 16 bit DMA audio output

SDMA sound/DMA Coprocessor

Standard Ports:

SCSI II port with DMA

High speed LocalTalk compatible LAN

Connector for analog RGB color (ST or VGA) or composite video

RS232C serial port

Bidirectional parallel port

MIDI IN/MIDI OUT

Stereo microphone input, miniature stereo plug

Stereo audio out, miniature stereo plug

Two joystick connectors

Two enhanced digital/analog controller/light pen connectors

Data Storage:

1.44 Mbyte floppy disk drive

Optional internal IDE Hard Disk

System software:

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)

Inter process communication

NewDesk desktop and eXtensible control panel

Multiple window user interface; number of windows limited only by memory or software in use.

We see this computer as exceeding all of the multimedia expectations of the computer buying public. As well as being an exceptional value as a home computer system.

Extensive testing with the Falcon has already been done on existing software. We are very pleased with the high degree of compatibility. For instance, PowerNet, a increasingly popular LocalTalk networking solution works fine with no modifications. Calamus SL, PageStream, WordFlair II, Cubase 3.0, STalker 3.0, STeno, Arabesque, and many other well written applications will work perfectly.

I would recommend hanging on to it. I used to have an 800XL with 256K of RAM, just about the entire ICD 8-bit product line, etc. Sold off all the hardware a couple years ago, but god do I miss the games. I really can't justify sinking much time or money into an 8-bit system, but I really regret having gotten rid of it. It was too much fun, even if my programming dreams lead me onto bigger systems, it was still a cool system to have around.

Perhaps the Amiga is the 90's evolved version of the 8-bit. I can't say for sure. I would have loved to be able to keep using it, but the 40 column screen got to be too much of a limitation...

Think very carefully about what you do with it. If it's really just going to sit in a box unused, perhaps you should donate it, but don't make any hasty decisions!

>As an ATARI 520STm owner of 7 years who has since (under much pain in
>the process, but still very wanting to promote ATARI) gone MAC, I am
>wondering what the hell a Falcon is.

The Atari Falcon is supposed to be the machine that will turn things around for Atari in the US. The model that's been talked about for lo these many moons, and about to be released in the US, is based on a 16 MHz 68030.

The video system is tremendously flexible, with graphics modes ranging from 1 to 16 bits per pixel, various resolutions. (The ROM supports up to 768x480, interlaced, or 640x480 noninterlaced, but you can tweak other resolutions as well...) All video resolutions are available on any color monitor, SC1224 style or VGA style. The SM124 style monitors can still only display ST hi rez, tho.

The audio system is also pretty slick, with 16 bit digital DMA-driven stereo audio onboard, and support for 8-channel audio with an external adapter. The audio section includes the same old Yamaha PSG as in old STs, for compatbility, and is also compatible with the digital audio in STes and TTs, as well as the new Falcon-specific stuff, supporting sample rates up to 50khz.

The system also includes a 32 MHz 56001 DSP chip with 96Kbytes of 0-wait state private static RAM. The DSP communicates with the main memory over a 1 MB/sec DMA channel. This is possibly the best feature of the Falcon, since the DSP is such a powerful compute engine.

Other stuff - SCSI-2 port, internal IDE port, 68882 FPU socket, 1-14 MB RAM, 2 STe style analog joystick ports, all the usual ST ports (except the ACSI DMA port), Mega STe/TT compatible Z8530 serial port, can't think of anything else offhand.

The 68030 is certainly not a screaming speed demon at 16 MHz, but it's still a very capable system. A 32 MHz version is rumored to be coming soon, probably will arrive before the 68040 version is released. (The 68040 version's existence was confirmed at Comdex, but the design was still being debugged. I dunno what's happened along those lines since then, but Atari hasn't talked about it much lately, so presumably it's still quite far from release...)

>getting data in and old just ridiculously slow.

I don't think it was the POKEY's fault. How could it be, when companies like Happy and ICD sold upgrade chips that would make your floppy drives transfer at 57600baud instead of 19200? But yes, I agree in general, I got very frustrated at the overall slow speed of the serial bus...

>micro-controllers. However, they are handy CPU's to have around, and
>(after years of experience), easy to (Assembly) program.

I don't really see much raw processing power in 80x86s or SPARCs. Sure, you can get a 486-66, but it still takes around 6 cycles to execute the average x86 instruction, giving you an effective 11 million instructions per second. Sure, you can get a 40 MHz SPARC to execute 40 million instructions per second, but you need a bunch of instructions together to perform the equivalent of what a regular CISC processor would do. A 16 MHz 6502 can execute 16 million instructions per second, and 6502s are very well understood processors. (That's the primary reason you see them as microcontrollers, because they *are* well

understood, and easy to program...) Of course, I wouldn't really want to do any serious engineering on an 8-bit processor, but mebbe one of the newer variants would be good. At any rate, clock speed and "raw processing power" just aren't the simple factors you make them out to be...

To think that Unix grew up on PDPs with less than 64K of RAM. I must admit that I've never seen any comparable system running on a 64K 6502 system. I wonder what a really good 6502 system programming language would look like. C is pretty much a higher-level abstraction of PDP assembler... Too bad OSS's Action! language didn't get more widespread use...

You bet. Here in Finland they are planning to sell them at ~US$2100.
Somebody ought to do something about it...

I don't think the importer is trying to get huge profits though, I
think they just get a bad price for the Falcon. I talked with the
Atari-guy at the firm that imports Falcon, and he _seemed_ sensible
:).

## 66. Atari in the Press (Jesus Jones & the 1040)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-17 00:29:31 UTC
From: goose@umcc.umcc.umich.edu
Message-ID: <1qnj1b$h2u@umcc.umcc.umich.edu>
Source record: 23202

I though some of you might like to see this:

PERVERSELY HIGH TECH -- JESUS JONES RECORDS ITS LATEST ALBUM STRAIGHT INTO A COMPUTER
by Gary Graff
Detroit Free Press, Fri. April 16, 1993, Page 1D reprinted without permission.

Mike Edwards is an admitted and unrepentant gadget fan.
The Current prize possession for the leader of the British rock band Jesus Jones is a Sony Video Watchman, a portable TV with built-in VCR that allows him to watch 8mm videotapes "when I can't sleep on the tour bus at 4 in the morning."
The Watchman replaces his last prize possession, a palm-sized personal organizer that holds everything from Edwards' Rolodex to lyric ideas for future songs.
But Edwards prizes all his video game ware -- the Sega Genesis and Super Nintendo system, the portable Game Boys and Game Gears.
"Echo the Dolphin" is the new addition to his list of favorite games, right up there with "Street Fighter 2."
"Then there's the politically unsound 'Desert Strike 2' " says Edwards, 28, whose other recreational passion is skateboarding.
The singer-guitarist is married, but fortunately Edwards' wife shares his passion. "She's enjoying beating the heck out of me on 'Street Fighter 2,' " he says, "but we do play with a massive handicap difference."
It's not surprising, then, to learn that Edwards and his band turned their latest album, "Perverse," into a showcase of modern recording technology.
In fact, Jesus Jones' method for recording "Perverse" -- which follows the group's 1991 smash "Right Here, Right Now" -- represents a new pinnacle in man-machine cooperation.
Unlike the standard album, which is recorded directly to tape, "Perverse" found the members of Jesus Jones -- Edwards, Ian Baker, Al Jaworski, Jerry De Borg and Gen -- recording their parts directly into the *Atari 1040* computer Edwards keeps at home. The singer-guitarist then sat at his terminal, tinkering with the sounds as he saw fit; parts originally played on guitar became keyboards or orchestral strings, bass lines became synthesizers, drum parts were turned into guitars.
The finished album, in fact, was handed to the engineer on a floppy disk rather than a reel of tape.
"All the performances consisted of a bunch of data instead of hard and fast notes on a piece of magnetic tape," says Edwards, who claims his computer literacy doesn't go beyond the basic skills needed to make "Perverse."
"We had an infinite amount of flexibility. Notes could be changed, the timing could be changed, the actual sound of an instrument could be altered into something else.

"You've still got people playing instruments, mind you. It's just that
later you can chop things up and change them around."
The key, Edwards says, was finding a way to turn this unorthodox
and largely impersonal approach to music making into a record that retained
the energy of a band performance.
"The whole point is to make this music that moves me, that induces
the adrenaline rush that I get from music I enjoy listening to," he says.
"It has to move you. Just because you use a different sort of
technology doesn't have to make it cerebral.
"I mean, there were mistakes made when we were actually playing our
instruments. And there were times where I could say 'Hmmm, this guitar part
is a bit out of time. I could hit this one button and put it into precise
mathematical time.'
"But then you say, 'Wait a second; it still has to be rock music.'
Maybe a little bit of out-of-time playing adds a little character to it,
so you don't use the technology to make it perfect."

Source record: 23208

Was the Atari ST ever considered to have comparatively good resolutions
and colors (i.e. when it was first announced), or was it designed with
obsolescent resolutions and colors to be cheap right from the beginning?
How would the ST's graphics compare to the IBM-PC, i.e. what graphics
mode is it comparable to..EGA,VGA,CGA?

## 72. Re: spam, Atari, and Amiga

Newsgroup: comp.sys.atari.advocacy

Source record: 23207

True color on the Falcon is Atari's 16-bit display mode where there is no color palette. Or rather, no color indirection. You can choose from 65536 colors (as opposed to AGA's 262144, which still hs a palette of 16.8 million).

I too used to own an Atari ST -- since 1986. But I sold out in December and got an Amiga 1200. Tired of waiting for the Falcon. And people are STILL waiting.

I lead a much more relaxed life now.

But I hold no malice toward Atari owners. Many of my friends are also Atari owners. Some are still holding their breath. I really hope the Falcon ships soon, because some of these guys are turning blue! ;)

I'm not here to start a war. There's enough of that crap going on elsewhere.

I'd say the original ST compared fairly evenly with CGA in terms of colours and resoloutions. I think the ST had a higher res (640*400), but EGA could do 16 colours in 640*350 (Not sure about this exactly, so no flames please..). The ST also had a slightly larger palette, since it had 512 colours, as opposed to EGA's 64. At the time it was pretty good, since state of the art on a PC was CGA (And even my old C64 made that look lame.)

Chris Brown

>How would the ST's graphics compare to the IBM-PC, i.e. what graphics
>mode is it comparable to..EGA,VGA,CGA?

I'll start with the facts first. The STs have 3 resolutions: high (640x400, monchrome monitor only), medium (640x200, 4 colors, color monitor), and low (320x200, 16 colors, color monitor). To use all 3, you need 2 monitors; the color graphics are more or less CGA, while the high res mono was probably aimed at the 5" screens on the early Macs (remember, this was in the mid-1980's).

When it was first introduced, the ST was competitive; the failures of Atari in competing in the U.S. market with the ST and later machines is a subject already well established, and viewed with sadness or glee depending on your peversity.

However, the TT has some higher resolution graphics modes (as does the Falcon), and the ST can display 512 color pictures (Spectrum software) with no extra hardware required, just a bit of clever programming (Thanks, Boris!).
Compared to the XTs and Macs around at the time, the ST was an incredible bargain, priced more for the home market than most competitors. The Mac was strictly a YUPPIE machine (expensive!), and IBM's gesture was the ill-fated PC Jr. (doorstop). Today, it's hard to get excited about anything less than 1280x1024 24-bit true color [no color table lookup], which isn't really available in a low cost machine (yet). Of course, I'm typing this on my ST...

## 78. Price / Availability of Falcon

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-20 00:18:16 UTC
From: jlrobins@uncc.edu
Message-ID: <C5rA6G.6zM@unccsun.uncc.edu>
Source record: 23214

Having been an Atari owned since the good old Atari 800 days, I am quite interested in hearing more about this Falcon. Tell me more about MultiTos (esp. with respect to *NIX). I take it that GEM is still around, as that it seems to be downward compatable. I've been out of the ST world for a few years, as that the community here in NC seemed to have dried up, and about the only thing I used the good old 1040 for was as a terminal for our mainframe here at UNCC.

As I was saying, can anyone give me a starting price for this beast. I still have a good color monitor. How about a good description of MultiTos? What about a good C compiler (I've grown _tired_ of my 1986 OSS pascal "system"). Has anyone seen one of these things? How about written code for one? It sounds really fun -- when can I get my hands on one?

Thanks,
James Robinson

>color graphics are more or less CGA.

!! CGA was 16 FIXED colours! That is VERY different from 16 user defined
colours from a palette of 512... especially when you look at the 16 CGA gave
you to choose from! (or was it less than 16? Anyway, they were fixed colours).

>at the 5" screens on the early Macs (remember, this was in the mid-1980's).

And it's almost the mid-1990's and the "Mac Classic" has a similar sized
screen.

Which isn't far from the truth... 8)

Must say that the HAM-modes is a pretty slick solution to keep the
video-bandwidth down and still have lots of colours to display. Allthough it
doesn't compare to a real pallette on 18 bits. But it's enough for the major
part of the available applications. Even Falcons 65536 colour mode is enough.
(Most people's monitors can't handle the resolutions anyway)

<rest deleted>

James, a better place to ask would be the comp.sys.atari.st newsgroup
(since there is no Falcon newsgroup) but I'll try to answer your questions
via email so as not to waste the time/bandwidth of others here.

I've forgotten, however, what the suggested retail pricing in US$ is for
the various Falcon configurations. Anyone else here recall?

Falcon030 RAM Hard Disk Cost
1 0 $799
4 65 $1,299

Now, those are the only two prices I have, and my dealer agreement w/ Atari forbids me of telling you any other. But, as a taster, our margin is HUGE so the price might (see that, MIGHT) be ALOT (say $100-300) lower.

Last price I got from my dealer was the following :
Falcon030 with 4MB RAM, no hard drive : $999
Falcon030 with 4MB RAM, 65MB hard drive : $1299

They said these were tentative prices but I think they will hold true.
Also they said they probably would only have the 4/65 units in to start
with (fine by me), and they didn't say anything about the 1MB/no hard drive
unit (maybe it's been recalled so that no one will get a 1MB Falcon -- let's
hope so).

Hello Jose:

It looks like you have:
Part # C025913-20
Built by/on: Atari Corp 1985 (year)

Here is the guesswork:
8520 might refer to the IC part type. I think an 8520 is a
Peripheral Interface Adapter (PIA) chip. Did this come from a printer
rather than a computer? More likely, since I think the 8-bits used the
POKEY or CTIA/GTIA chips and the 6821 chipset as PIA's.

3H-2130-CC proabably refers to some other date code, or
manufacturer's code. At least that's normal for regular chips.

There's not much else I could tell you, without knowing type of
device, where it comes from, location on circuit board (usually
silkscreened, something like U4), and how many pins it has, as well as
pinout configuration (most likely DIP configuration in .800" package).

If it really is a 8520 PIA, I think that is either a 28 pin package
(maybe 40, but I don't have a databook around right now), and it comes
in a .800" spacing (0.8" width between rows of pins on either side of
chip), and .100" pin spacing (0.1" spacing between adjacent pins.
Don't quote me on that, I haven't got a databook handy. 8520's are
relatively cheap, and would probably be less than $10, if you look
around at chip dealers (try somebody like Digi-Key in Minnesota,
they're good). Can send 800 number later (it's not handy right now
either). Good luck...

More probably it's the year and week the IC was manufactured.

[stuff deleted]

It would help a great deal if you (Jose) could specify how many pins it has,
and where it is located on the PCB.

Just curious... have you ever actually *seen* HAM8? It looks just great.
All these very-many-colors modes like 16 bit or (fake) 24 bit aren't
used for fast animation, but for steady images.

And in that case, HAM8 has more colors than the Falcon...

>the price might (see that, MIGHT) be ALOT (say $100-300) lower.
Hmm, other dealers have been saying that Atari isn't providing them with the opportunity for large margins.

I'm not saying one way is right and the other is wrong; it's just interesting to hear another dealer say something that differs.

## 98. MCD sells 24 Falcons

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-22 19:10:26 UTC
From: oyakea@warren1a.its.rpi.edu
Message-ID: <bv15pa_@rpi.edu>
Source record: 23236

Yes, like the title says, Micro-Computer Depot of N.C. sold 24 Falcons
on wednesday. When I last called they had only two left. They are back
ordered by 65,000 machines. I was informed that the machines were 4meg models
with harddisks in them. I do not know the validity of the statement about
back orders, but the sales rep seemed mighty happy.
SPREAD THE NEWS THE FALCONS ARE HERE.
He said the only problem is that the factory producing Falcons
produces only 2000 per week, and that can not satisfy demand.
It is sad that there is only one falcon factory, if its gone its bye bye
atari :( :(.

SML108> Sheesh, my lynx is doing just fine, Sinc-hole. Life must be
SML108> really bleak for you...

Is there any new software coming out for the Lynx? I have one and am really
bummed about the current state of new releases for it. Electronic Gaming
Monthly lists upcoming releases for platforms each month and has listed the
Lynx as "no new releases" for two months in a row now. They haven't had any
Lynx reviews or news of upcoming softs for even longer. The previous months
new releases were like 1 or 2 titles. My local Software Etc. just dropped the
Lynx last week as well. The two other places that carry Lynx stuff haven't
gotten anything new in almost six months! The Lynx is a neat idea but it looks
*dead* to me.

They are great little portables but I'm wishing I had gotten a Game Gear
instead, now. It's really disappointing that almost no new good games
are coming out and there is not a single fun RPG out for it (like Final
Fantasy on GB). If it weren't for STUN Runner, I'd sell my Lynx today.

Hmm...at least we'll have to wait a *long* time for a new casing, too.
Reportedly they have made 150K casings and with a production volume of 2K a
month that means we'll *maybe* see a new casing around next X-mas...

Oh well... I just hope they get this bird off the ground fast...

Two new games: Power Factor and Dinolympics are not in stores but can be
ordered direct from Atari by dialing 1-800-FAR-5151... Battlewheels, the
upcoming 3D multiplayer Road Warrior game is just around the corner...
Reviews in the electronic gaming rags have stated this is possibly the
best game ever written for the lynx... I suspect that the lull in
lynx activity has been due to the trials and tribulations involved
in finally getting the falcon out. Yes, it's out in the US NOW...

Remember, this is Atari, the niche market company. That's the way they
do things. That's why they never seem to die but never dominate the
industry either... These guys can survive anything but the key word
is survive... The word thrive doesn't seem to be in their vocabulary...

>They are great little portables but I'm wishing I had gotten a Game Gear
>instead, now. It's really disappointing that almost no new good games
>are coming out and there is not a single fun RPG out for it (like Final
>Fantasy on GB). If it weren't for STUN Runner, I'd sell my Lynx today.

Hmmmm... What about Shadow of the Beast? Electrocop? Dracula?
Bill & Ted's Excellent Adventure? And if you don't like Warbirds or
Checkered Flag, perhaps you should have indeed bought a Game Gear
as these are the games that the lynx is best for and which seem
stink on the Game Gear...

>--
>.. I want to perform cranial activities with Tuesday Weld!!

Why? She's old and oogy now... Kind of like Madonna in about
five years... I think I'd prefer playing my Atari 2600 to playing
with Tuesday Weld...

Your wrong on both counts...I own an Atari lynx. The lynx is a superior
product compared to others, but was doomed because of inferior marketing. The
samething will happen to the Falcon...

I am an Amiga 1200/80 meg HD owner- I love it. At least I did not have to
wait. for mine..

Later..

Well, not quite correct : a more accurate translation would be :
girl friend, i.e. a friend who happens to be female. 'Novia' means
girlfriend.

>Yea..Apple can top that, they have about a million unit back order...

Hehehehehe... hoo boy. Another brilliant post by "Mr." Sinclair. I like Apple's toys too, but even Guy Kawasaki isn't as much a Mac evangelist as _this_ guy. Sinclair, you don't even know enough to avoid taking the bait of such an obvious trap as this one. MCD backordered by 65,000 units? Yeh... surrrre they are. Hahahahahahaha

And besides, if Apple's entire manufacturing facilities consisted of the kitchen of a one Taiwanese family, how many could THEY pump out per day? :)

## 120. atari.archive.umich.edu bi-annual faq

Newsgroup: comp.sys.atari.advocacy
Date: 1993-04-28 02:22:48 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1rkppo$m57@terminator.rs.itd.umich.edu>
Source record: 23155
Cross-posted to:
comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,umich.archives,umich.post.myke.post,alt.felching.gerbils

The atari.archive.umich.edu "Just the 'faqs' faq" - an Umich Atari Posse Product

This faq has been revamped to provide just the "faqs", less talk
and more rock. Ready?

1. How the hell do I get to atari.archive?

By order of preference:
1. AFS (if you don't know what it is, you don't have it, forget I
mentioned it).

2. Gopher (Other gophers/North America/USA/Michigan/Merit/Software
Archives).

3. FTP - Be sure to check for mirrors that are closer to home. For
instance src.doc.ic.ac.uk (/computing/systems/atari/umich) and
wuarchive.wustl.edu (/mirrors/archive.umich.edu/atari).

4. Mail - Send mail to atari@atari.archive.umich.edu with a body
of help for the help file. Questions about BART to
brode@atari.archive.umich.edu

2. Uploads?

You bet we want 'em. Via afs, cp into /afs/umich.edu/group/itd/archive
/atari/New. Via ftp, ftp into atari/New (will not work at mirrors).
Via gopher, impossible, see mail. By mail, uuencoded chunks to
weiner@atari.archive.umich.edu.

3. Sacrifices in our honour?

You bet. Small children and farm animals only please.

4. Why the hell do things take so long to get from New to the
archive?

Lack of spare time. Lack of sacrifices. We're working on it. Really.

5. I'm completely confused by this post, who can clarify it for me?

I'll do my best, weiner@atari.archive.umich.edu. If that don't work,
weiner@terminator.rs.itd.umich.edu. If that don't work,
weiner@stat.umn.edu. If that don't work, weiner@beryl.labmed.umn.edu.
If that don't work, Jeff Weiner 414 Erie St SE #14, Mnpls, MN 55414.

Good night,

Yeah.. but does it matter? So long as it sells well, who cares if you have
a million or 65000 back order?

Yes I know that means the mac will get more software but as long as we have
some software, we'll be happy.

The PC probably has 50 million back ordered between all the clone companies.
Being number on isn't the point here.
The point is that the Falcon IS SELLING and probably outselling its ability
to produce te buggers. This is a good sign.

>just from your header, there is one that has 17 characters:

PA> NNTP-Posting-Host: access.digex.net

NNTP-Posting-Host is a news header, not an RFC841 mail header.
(BTW - what is the news header list, RFC-1036? )

PA>Keep in mind that uqwk is piping the message into ``mail'' which
>does not accept headers other than those specified on the command
>line. If you want full header to be included, you would need to
>interface with ``sendmail'' directly.

Yes, you would. But you *can* use "~ escapes" in a message to give
commands to mail; it says so in the documentation. It's called a tilde
escape and is done by putting a ~ in column 1 along with a 1 letter
code, t for additional addressees, s for new subject, and the mailer
will take these as additional commands. The answer is to make sure
there is a line with a single . and a blank line so that the piped
incoming message skips the damned cc: prompt mail makes if you send it a
message with tilde escapes. Now the eof on the pipe might work for that
purpose, who knows.

I'm going to edit a test reply of this for the mailer as well, so you
will both see this in news and receive it in mail, since the
off-line-reader easily makes carbon copies. No reply will be needed,
it's mostly to confirm what I suspect, that I can use tilde escapes to
send a message mailed to someone.

PP>Is there a real need to include the header in a reply? If this is the defaul
>in uqwk I think it has to change.

I was simply showing that the system *does* give me the header of a
message; it was for demonstration purposes only. In normal messages I
just keep the "important" parts (so other people reading know who I'm
responding to, which may not be evident from the material written.)

PP>: Please do; post it again. Once everyone has their two cents, we can
>: submit the specification to be published as an Internet RFC. I am going

>I definitly don't want to see this format as a standard for the future!

Why not? It is in use by perhaps 100,000 people or more, based on
perhaps 5,000 US BBSs and and an average of 20 per board using them.

PP>The sooner we get rid of that ugly format the better!
>(this is not an attack against uqwk or other off-line readers who
>try to do their best with the qwk format).

Like it or not, 'ugly' or not (beauty is in the eye of the beholder) the
QWK format has many advantages: the software is here, now; the
implementation of a reader is easy; the format is published and easily
implementable; it is essentially non proprietary (the claims of
Sparkware to the contrary notwithstanding, as it's been figured out by
other people); and there are public domain implementations with source.
Both sides - door and reader.

Other people have come up with proprietary formats for their own
specialized readers. Nobody bothers with the formats for Megamail,
because Kip Compton has them as proprietary, same as his message format
for the RIME network. As a result, Megamail now accepts QWK packets.

PPP and POP-3 are methods of doing the same thing on internet. They are
also not very popular because you need either a TCP/IP connection or you
need a slip dialup. Then you get into issues of having to debug your

connections to the host, and so on.

To use QWK packets requires: 1. A QWK packet reader (100K); 2. an editor (many come with one or you can use your own if the reader can spawn to it) (30K); 3. a packer and an unpacker like ZIP, ZOO or LHA (100K); 4. a comm program and a means to upload and download packets (250k).

Outside of the disk space used for the packets, the whole thing can be done on a 360K floppy-only system since you don't use all of these at once. I've done it. As long as you keep the packets small, you can fit everything in. It's work, but it's still small.

I have heard someone even implemented a qwk processor to operate on a TRS-80. Remember that? A 64-K 8080 processor.

PP>I may post SLNR again today.

I'd love to see the specifications.
>: ---
>: ~ OLX 2.1 TD ~ Close your eyes and press escape three times.

PP>I don't know where this "---" comes from but it is not the standard of a
>usenet signature. If possible you should configure your off-line reader to
>use "-- ".

I can't do anything about that. The standard in QWK is to use three dashes for the tear line. However, to fit in to usenet, I switched to "fido" style tags which simply put no tear line and an * on each end of the Reader Trademark.

* OLX 2.1 TD * Our Telex service runs at a blinding 50 baud.

RL>The QWK format cannot be proposed as an RFC without the permission of the
>original authors. I can't recall who that was offhand; I think it might
>have been Mark Herring (Deluxe^2, QMail4)

I'm talking about informational rfcs, not proposed standards.

Considering that published documentation of this format has been
released by no less than three different groups, one who released a
complete document specifying the format, and others who released all of
the information about it, it would be a little hard to claim that this
is proprietary in nature. If that is true, then if someone creates a
method of doing something who fails to police any rights in it, but
still claims it is proprietary, it could never be documented.

That also depends on whether you consider the QWK format to still be
proprietary. I don't; he's failed to police any proprietary interest in
the protocol by not cracking down on people who wrote competing programs
using the QWK standard without either requiring them to license the
protocol or making them stop creating unlicensed released. This assumes
the method was proprietary since most of it was lifted verbatim from the
PCBoard message specifications which were stolen from RBBS anyway.

RL>>The sooner we get rid of that ugly format the better!
>>(this is not an attack against uqwk or other off-line readers who try to do

>From: patlee@panix.com (Patrick Lee)
>Subject: Re: qwk and usenet
>Date: Tue, 27 Apr 1993 04:07:42 GMT

PA>PR> UQWK, which is in release 1.2 does.

PA>It is now in released 1.4 and handles > 25 character long email
>addresses. It may be obtained by anonymous FTP from:

PA>ftp.gte.com:/pub/uqwk/uqwk1.4.tar.Z

Good. I'm going to pick it up, and ask my admin to install it.
If it isn't already.

PA>In addition to handling longer To address for email, it can also
>access news from NNTP servers.

PA>PR> (It identifies itself to readers as QMAIL, so any ADD/DROP
>PR> commands would be sent to QMAIL; but its "name" (for config
>PR> purposes) is UQWK and it mails the user nasty messages if
>PR> they send it a QMAIL command).

PA>Actually, uqwk will accept commands sent to Qmail, MarkMail, and
>a number of others too. But yes, it does not like the tradi-
>tional add/drop commands but it provides option to obtain the
>entire .newsrc file, for example, which is nice.

uqwk - in the release we have - specifically REFUSES with a "nastygram"
(a mailed message back to the poster) that QMAIL is not a valid command
name to send config requests to.

PA>This message is coming into the network using a PC-based QWK
>reader and uqwk. It contains full header with > 25 character
>long subject line as well as reference line for threaded news
>reader to use.

Good! What reader do you use?

PA>I can't think of an easier way to read news off-line from a UNIX
>system. And no, setting up uucp or Waffle is definitely not
>easy!

Oh yes. An off-line reader is the *easiest* way to handle message
transfers that has been developed. Everything else requires
work, work, work. Lots of it.

* OLX 2.1 TD * I'd be glad to help you out...which way did you come in?

PA>PR> Do you really want to propose the QWK format as an RFC???

PA>This will never work as the QWK format is a constantly changing
>format.

Would you like to say the same thing about RFC-841 mail? Mime came out
to add multimedia capabilities. The old stuff still works. New
features update the old stuff.

Do you know that in SMTP there is, in addition to the old HELO query to
tell sendmail what system you are, there is an EHLO command to use the
new features provided for MIME capability? Yet most sendmail / SMTP
systems do not implement EHLO. (Yet.)

Would you like to say the same thing about Telnet since there were
options added for 3270 terminals, special processing and more?

>In fact, there will be two major changes to it in the
>not too distant future. One involves adding netmail support into
>the header itself. The other involves secondary headers, which
>is some new feature in PCBoard 15 which no one can tell me yet
>because they are bounded by non-disclosure statements. But once
>PCBoard 15 goes into wide beta, we can all see the changes. And
>according to someone in the works, it has wide support from many
>authors.

So? When the method changes, change the specification to add the new
features. As long as the changes do nothing to old reader programs,
there should be no problem.

PA>PR> I definitly don't want to see this format as a standard for
>PR> the future!

PA>Unforuntately, it is here, and it is popular, and it has support
>on virtually every computer platform now.

And now that it's available for UNIX (and by derivation, any system that
has spawnable news and mail, which includes VMS and possibly VM, it
could start propagating out to the rest of the Internet.)

PA>So far, I have not seen a real effort in creating a new standard
>to replace it. And I have been around long enough to see all
>such efforts rise and fall -- since 1988. Blue Wave format is

>supposedly a nice format. But its owner has not released it yet!
>Though it still may be too limited for USENET & Internet pur-
>poses because it is bounded by a fixed header structure.

Every other proposed "standard" fails for failure to release and publicize. Kip Compton won't release details on Megamail's interface to a bbs except under an nde. Megamail fell by the wayside because of this and now accepts QWK packets too. You mentioned Blue Wave as another undocumented format. All of these and others that came along had serious problems, the biggest being trying to use a proprietary format when open is the most common method.

Ok, I've posted this message acrose the 3 main atari groups.

Is there a good history of atari and its machines?
Here is what I have constructed from word of mouth, my memory and old
issues of Compute!.

1. Early 70's. Atari founded by Bushnell releases the pong arcade game. It
was a use sucess and atari began its climb.
2. 1976, Atari had made a cartridge game system called the VCS (Video computer
system, later called the 2600). However it took a year to reach to market
because most stores didn't think people would buy such an expensive toy.
3. 1979, the VCS was a huge success. With the release of the Apple, Atari
started to develop its own home computer. I'm not sure when the 400 was
released but I assume before 1981.
The computer they release was the 400. it has 16k ram and uses the 6502
chip for the CPU. As far as I can tell it ran a 1 mhz. An upgrade
version called the 800 was released with a real keyboard and 48 k ram.
4. 1983. While the computers sold well, they appear to be losing a war against
the commadore 64 and other computers. And while their billion dollar baby
the VCS keeps making money, systems like the Intellivision, Collecovision
, computers and time itself has warn it down.
(at some tome they released the 5200. A video game system based on the
atari 400. I'm not sure when this happened. It was a failer)
5. 1984. The video game industry when bust and alot of companies where
destoryed by it. The company that own it, warner bros sold it to Jack Tramiel
in mid 84.
Also, atari developed the 7800. a revolutionary game system that was delayed
for so long ~(I think 86 was when it offical was released in real numbers and`
the nintendo, a surperior machine, although also developed in 84 had bet them
to the punch)
5. 1985. With the winter CES Tramiel Atari released the 130ST, the 520 ST and
the 65 XE. The ST line (ST stands for Sixteen/Thirtytwo) were revolutionary
machines that were twice as power as anything else on the market. They used
the GEM windowing system and had Color and used the 68000 chip. They were
nick-named the Jackintosh.
The 65 XE and the 130 XE were updated 8bit versions of the 800xl. I can't
find what xl were released and when.
6. the time between 86 and 91 is very hard for me to track info down. I was
very into the IBM PC world and got few mags that said anything about Atari.
I do know at some time the 5200 and 2600 (VCS) were dropped. The 8bit
line was taken down to one game computer called the XEGS. And ST's didn't
sell well or were run over by PCs Also there were other ST models released
called 1024, STE, and the TT.
7. 1991. Atari bought the Lynx hand held game system from EPXY and cannceled

the 7800 and the XEGS.
8. 1992 to present. Things look pretty bad..

ok, anyone care to fill in details or point out my mistakes in the time line?

Yeah. I unfortunately am one of the ones that own a little Atari stock. It reached a high of $13 somenthing since I bought it. (This was several years ago)...

Now it is hovering around 75 cents as you said.

Last year Jim Trageser posted a summary or the different models of the
Atari computers which was also a kind of history of Atari. I can repost
his article if he isn't around to do it again himself.

For sale:

Atari Portfolio Palmtop.

including Smart Parall Interface, 4 memory cards, case

$200 or best offer. Plus I'll pay shipping.

this pofo is only a year old, plus lotss of the stuff I've got with it really increases the value. It is ideal to use as an electronic day planner, text editor, and address book. Also it has a nice Lotus 123 spreadsheet.

I don't need it cause I left school but its great for students. Also it is DOS compatable.

please mail soon if you are interested.

The Atari 400 on PAL systems ran at 2MHz. I think on non-PAL it was 1.7MHz,
or something like that.

>And ST's didn't sell well or were run over by PCs Also there were

ST's were actually VERY successful (they aren't now, true).

HUH? Aren't you going to mention any more about the Lynx? Falcon?

(Oh, and I guess the couple of ATWs that were sold should also get a mention)

>going.

Ok, I don't mean to criticize Dave Small, I'm sure he's a great guy and he has done a lot for the Atari Community. But your statement that he is somehow single-handedly responsible for "saving" it sounds completely bogus. Shouldn't you give credit to the numerous other dedicated dealers, software houses, and users who have kept Atari afloat? I don't own a single product from Gadgets yet somehow I don't feel the need to run off and buy an IBM because they have better "business ehitcs," as you put it. Do you really think that 90% of all Atari business is a result of one particular product. I doubt it.

Let's give credit where credit it due here, there are a lot of great people all trying to support the Atari Community and I don't think it's fair to point at one particular person as the savior of Atari.

>can't survive without the Amiga...
>

What exactly is your point? The guy comes on with a normal, friendly post about
how he likes the Falcon, and you respond with some sort of half-cocked generality
that is obviously inflammatory. Who really cares if Atari and Amiga dealers are
coexisting now? Neither one of them has enough market share to compete with MS-DOS
so they might as well try and stay together... (or would you rather all Amiga/Atari
dealers were really MS-DOS dealers moonlighting as Amiga/Atari dealers?)

Our local dealer is exactly that right now : An Atari dealer selling mostly MS-DOS
software/hardware, with a small Amiga section as well. The way I see it, I'd
rather have a small Atari section than no Atari section!

Note the followup is to comp.sys.atari.advocacy, let's keep it here. Thanks...

What ever happened to the fabled ST Book that I kept hearing from Atari" Real soon now"....Thats the onlything that they are good at...

Once again Apple is head of the curve. Next month will start another round of product introductions..

PowerBook 145B a cost reduced version of the 145 with the exact functionality and features will have a price of $1500 for the 4/40 config(street prices may below $1000) and the 4/80 is $1700...

Later...

The Atari 800 and 400 almost identical internally. The key differences
that make an Atari 400 different than an 800 are the plastic membrane
keyboard and only one rom cartridge slot instead of two. Things like the
processor, graphics chips, etc are the same.

Atari 800/400 cpu is a 6502B running at 1.79 megahertz.
The orginal graphics chip was the CTIA followed some years laster by the GTIA.

The 800 was introduced with only 8k of memory, (I have seen a 4k cartridge
so I assume at one point they were thinking about that).

It may interest some of you to know that the 16k cartridge and the 8k cartridge
are also very nearly identical. Both carry 16k chips, but the 8k cartridge
has been wired so that only 8 of the 16k are accessable. For those with
some soldering experience the conversion of the 8k board to the 16k board
is not difficult.

>chip for the CPU. As far as I can tell it ran a 1 mhz. An upgrade
>version called the 800 was released with a real keyboard and 48 k ram.

The Atari 400 and 800 were released in 1979. They ran at 1.79 MHz,
exactly half the NTSC colorburst frequency. The 800 was released at
the same time as, if not before, the 400. It also came with 16K of RAM,
officially upgradable to 48K (as opposed to the 400 which had no Atari-
supported RAM upgrade path).

>4. 1983. While the computers sold well, they appear to be losing a war against

>(at some tome they released the 5200. A video game system based on the
>atari 400. I'm not sure when this happened. It was a failer)

Commodore had better marketing than Atari. Their advertisments actually
made it look like a better machine.

>5. 1984. The video game industry when bust and alot of companies where
>destoryed by it. The company that own it, warner bros sold it to Jack Tramiel

>for so long ~(I think 86 was when it offical was released in real numbers and`
>the nintendo, a surperior machine, although also developed in 84 had bet them
>to the punch)

I've said it on many other newsgroups, and I'll say it here. My belief is that Warner's selling of Atari to Jack Tramiel was the _cause_ of the industry downslide, not the result. If Warner had not split apart and sold Atari, the 7800 would have been released in 1984, possibly holding Nintendo to a tiny market share. Also, Atari probably would have retained the Amiga, and with Atari's arcade licenses intact all the popular arcade games would have been available for the Amiga.

Atari was the undisputed videogame maker from 1977 - 1984, from videogames to computers to arcade games. But as Atari grew it was managed more as a traditional big business, a fatal mistake for a market that requires creativity and innovation. Warner, instead of trying to salvage the company, took a tax write-off and sold it.

The intense interest in comp.sys.atari.8bit and rec.games.video.classic proves that the videogame demand was not dead in the early 80's. It was the _supply_ that was dead. With Atari out of the picture, there was no supply.

>5. 1985. With the winter CES Tramiel Atari released the 130ST, the 520 ST and

>nick-named the Jackintosh.
>The 65 XE and the 130 XE were updated 8bit versions of the 800xl. I can't
>find what xl were released and when.

The introduction of the Atari ST was an incredible marketing coup against Amiga. When Commodore stole the Amiga from Jack Tramiel, Jack had the ST designed in six months. The price/performance ratio was phenominal, mostly because the entire OS, a very much Apple-like GUI, fit in less than 512K of ROM. Compare that to 10MB of hard drive space for Microsoft Windows. Coupled with 3.5" floppy drives that weren't brain-dead like the Amiga's, it was not necessary to purchase a hard drive for an ST. In fact, with an entire megabyte of memory to burn, you just put everything in a RAMdisk which of course was even faster than a hard drive. The slowness of followups, couple with the release of the Amiga 500, 2000, and its Kickstart 1.3 OS killed the ST a bit prematurely.

>6. the time between 86 and 91 is very hard for me to track info down. I was

>8. 1992 to present. Things look pretty bad..
>

>ok, anyone care to fill in details or point out my mistakes in the time line?

You did not cover the splitting of Atari explicitly. When Warner sold Atari to Jack Tramiel, it kept the arcade games division. Warner eventually broke that off too, and it became Atari Games. Last I heard, Warner bought back Atari Games. Also, Tengen is a subsidiary of Atari Games; Tengen makes software for the NES, Genesis, Amiga, etc.

One interesting note about the 'price wars' that Atari and
Commodore engaged in. While Commodores marketing did indeed
tend to depict the C-64 as a better machine than the Atari,
the ultimate victim of this battle was Texas Instruments.
The TI-99 was being sold for *less* than it cost TI to
produce the thing. We all know what happened.
TI dropped out of both the war, and the market to produce
a viable home machine.

I can also remember some stuff that K-Mart was using to sell
the C-64 over the Atari. It was a 4 or 5 page comparison of
the two machines that was loaded with blatant lies and
mis-truths about the Atari. Too bad Atari didn't sue the
crap out of them for that, but 'tis no use crying over spilt
milk. When it comes to aggresiveness, Atari had and still has,
a backbone made of jelly.

Lorraine, so Amiga sold to Commodore. That's business.

> had the ST designed in six months. The price/performance ratio was

Well... The ST was already being designed when Atari was offered the Lorraine.
that's why Commodore could outbid them (well, OK, so C= had more money, too ;)

> phenominal, mostly because the entire OS, a very much Apple-like GUI,

Ah yes. Remember the Apple vs. DRI lawsuit? ;)

> fit in less than 512K of ROM. Compare that to 10MB of hard drive space

Nope, the original 520 ST had TOS on disk.

> for Microsoft Windows. Coupled with 3.5" floppy drives that weren't

MS-Windows? NOBODY used MS-Windows when the ST came out. People were using GEM
(the PC version) back then (and boy did THAT suck).

> brain-dead like the Amiga's, it was not necessary to purchase a hard

*cough* Amiga drives are NOT brain-dead. They support both MFM and GCR encoding,
and store 160k more than PC or ST drives... And the ST didn't have properly PC-
compatible drives until TOS 1.4 anyway. So :P

> drive for an ST. In fact, with an entire megabyte of memory to burn,

Yeah, RIGHT. 520ST == 512K ram. The 1040STF didn't come out until later...

> That's 1040ST.

'The first 1meg computer for under 1000 pounds.' Looong time ago ;)

Nope, the original 520 ST had TOS on disk.

Uhmm, that was very preliminary, and version 0.9 of the OS.
Yes, I actually have one of those, with mushrooms instead of bombs.
I still think it is sad that they removed the mushrooms...

*cough* Amiga drives are NOT brain-dead. They support both MFM and GCR encoding, and store 160k more than PC or ST drives... And the ST didn't have properly PC-compatible drives until TOS 1.4 anyway. So :P

Sort of wrong...

The st has always been able to read/write MS-dos disks. The trouble was with MS-dos, which didn't (and still don't) bother to check what is said in the boot sector about #sectors/tracks etc. and always assumed that floppies are 9 sector, 80 tracks. And they also needed a little magic value in the bootsector. ST-FORMATTED disk could not be read/written on a PC unless the disks were 9/80 and that magic number was there. Thus, to make an ST disk readable for a PC, the only thing that had to be changed was 2 bytes in the boot-sector. Oh well...

> drive for an ST. In fact, with an entire megabyte of memory to burn,

Yeah, RIGHT. 520ST == 512K ram. The 1040STF didn't come out until later...

Yeah, but everybody I knew at the time upgraded to 1 Mb ram as soon as they received their machines... :-)

How do Atari RAM disks work? Like Amiga RAM: (grows and shrinks and is

always there), or like RAD: (has to be mounted and is fixed size, and recoverable after warm boot), or like MS-DOG (has to be mounted is fixed size, can cause conficts with some progs, dies after warm boot)? Just curious.
>of the Amiga 500, 2000, and its Kickstart 1.3 OS killed the ST a bit

Atari loaned money to Amiga, Inc. to fund the development of the Amiga. While Atari was being sold to Jack Tramiel, Commodore bought Amiga and paid off their debt to Atari. Apparently legal, but the ethics are questionable.

>Umm, the Amiga 1000 that I have has an original drive and can read 720k
>DOS disks, and Atari disks with a simple utility. It also allows long file
>names, something that is still a problem for Atari, as evidenced by talks
>on the other Atari newsgroup. Mac drives are the brain dead ones.

Reading ST & IBM disks on an Amiga is even slower than reading Amiga disks. As you probably know, to read a single disk sector the Amiga must read the entire track of _raw_ data, then the 680x0 decodes the MFM encoding. Coupled with the fact that the directory structure is a linked list, practically the entire disk has to be read every time you want a directory.

>How do Atari RAM disks work? Like Amiga RAM: (grows and shrinks and is

>recoverable after warm boot), or like MS-DOG (has to be mounted is fixed
>size, can cause conficts with some progs, dies after warm boot)? Just
>curious.

Due to the abundance of memory, it seems everyone and his brother wrote his own RAMdisk. I just used the first one I found, which was fixed-size non-recoverable (and with the huge capacitor on the 1040ST's power supply, the RAMdisk could retain its information after 10 seconds of no power -- handy for thunderstorms).

>The original Kickstart ROM release was 1.2. It did not support autobooting
>hard-drives. I always liked having a kickstart disk, instead of ROM.

My mistake. I meant to say Kickstart 1.2. When 1.2, the 500, and the 2000 were released in 1986, it was the death of the ST.

>What happened to Atarisoft? They made Atari games for other platforms.

I believe that was just a product name used by Atari and not a separate entity. I could be wrong.

Basically, Jack Tramiel wanted to turn Atari into a computer company, not a game company. That is why he killed the 7800 just as it was being shipped to distributors. And presumably, that is what happened to Atarisoft as well. Actually, it's Tengen (a subsidiary of Atari Games) that now makes the software for the other platforms. I guess all the arcade license went with Atari Games in the split and not to Atari, because I believe it is Tengen that makes the arcade conversions for the Lynx, not Atari.

Gee, that's odd. According to the Atari ST User and St Review that I just
picked up (April issues), there is new software being produced for the ST
even as we speak. Pretty active for a dead machine.

Larry Richardson

Yup. You can't really try and tell us that Amiga drives aren't very peculiar. I'd love to know why Amiga did their directory structures like they did (though I think I remember hearing something about disk-fixing), because my friend's A500 GVP harddrive used to take as long to read a directory as my Atari floppy drive, especially the root directory!

>Atari loaned money to Amiga, Inc. to fund the development of the Amiga.

Wrong. Amiga Inc. was founded by 7(?) doctors etc. who wanted to invest money in something profitable. After a while (sometime 1984/1985) the money was all gone. Amiga Inc needed more money and Atari loaned them $$$. The development(sp?) went on. They came to a point where the loan from Atari took an end, and they had to look for more financial backing. Atari made a shitty offer for the stocks in Amiga Inc, and at the last moment C= made an offer which was twice what the pesimistic people at Amiga Inc. had hoped to get. So Amiga Inc. pays back the loan to Atari and becomes part of C=.
There might be finer legal points to the story, but I don't know those :).

>While Atari was being sold to Jack Tramiel, Commodore bought Amiga and
>paid off their debt to Atari. Apparently legal, but the ethics are
>questionable.

_IF_ Atari had paid for the initial development I would have agreed, but they didn't.

[about the Amiga diskdrives]
Much of the speed/slowness of disks of the Amiga boils down to a question of software. If 1.0 had the same optional filesystems that 3.0 has then Amiga disk drives would never have been called slow I think. The caching of directory entries is rather smart.

(And I still would like to find the source to StXformer :)

Again, Atari were beaten to it, when the even more revolutionary Amiga appeared
before it. However, Commodore overpriced their machine (256K RAM and WB1.1),
which gained a reputation until WB1.3, of crashing so regularly that you could
set your watch by it.

I'm still sure 'ST' meant Super Tramiel. :)

>
>Commodore sold 1.6 million units in 1992...

And OS/2 2.0 sold 3.1 million units in 1992. And its still not getting
much development in the way of software from major firms. Apple has been
selling lots of units for a long time and people are willing to buy
expensive packages for it.

The Amiga on the otherhand probably doesn't have 7 million units yet and
just about every major company is abandoning it.

Now, what does that mean to Atari Falcon? Probably nothing good. But lets face
it. If you have less than 10 million units out there, your just as a hopeless
cause as the person with 65000 units.

>Amiga 1200/80 -- Its like God!! ----- I love it!

God created the world in 7 days. Commadore can't even come up with a descent
software base in 7 years. God? I think not.

Well, I've had a couple of email requests for this article, so here it is.
I make no claims as to it's accuracy.

==========

SUMMARY OF DIFFERENT ATARI MODELS FOR ISSUE 1004

by Jim Trageser (trag@pnet01.cts.com)

For a company that has never learned how to market its products, Atari
has produced some of the best computer hardware in the history of home
computing. From the ground-breaking Video Computer System game machine
that revolutionized consumer electronics through the 400/800 family of
8-bit computers to the powerful ST/Mega/TT line of 16- to 32-bit
machines, Atari computers have generally been at the cutting edge of
electronic technology.

Atari's founder, Nolan Bushnell, is the man who made it all possible.
Inventor and developer of early electronic arcade games, Bushnell
targeted the home market in the mid-1970s with the legendary "Pong"
system. "Pong" was a largish console with two knobs on each side to
control the "paddles" on the television screen. With only one game,
the tennis-like "Pong," built into the system and no cartridge
capability, this primitive ancestor to modern electronic games was a
best-seller in its time.

A few years later, in 1977, the VCS (later designated the 2600) system
was released. With removable joysticks and/or paddles and a variety of
games available on cartridge, this system stormed the United States,
setting sales records that wouldn't be broken until the Nintendo
Entertainment System in the late 1980s. In addition to the Atari
games, companies such as Parker Brothers and Activision also developed
and marketed games for the 2600 as well as the Sears version of the
system, sold under license from Atari.

In 1979, Atari responded to the success of the Apple II and Radio Shack TRS-80 computers by releasing the Atari 400 and 800 home computers. Originally sold with just 8K and 16K of memory, respectively, and a cassette tape storage system, the two computers were based on the 6502 microprocessor, the same chip as used in the Apple and Commodore 64 machines. But the Atari computers were designed to use enhanced graphics, including 256 colors, by use of a separate graphics processor.

The 400 had a membrane keyboard, making it useless for touch typing, while the 800 had a regular keyboard. Both were upgradable to 48K of RAM. Soon, floppy disk storage systems became available for both computers, along with printers and modems, making them complete home computer system. Both Atari computers could also use televisions as monitors.

Both the 400 and 800 had cartridge slots for running cartridge- based software, although these carts were different from and incompatible with the 2600 game machines and subsequent game machines. In addition, the 800 had a second "right-hand" cartridge slot for future development, although few -- if any -- applications for it were ever released. Both computers could also use the 2600 joysticks, and had four joystick ports as on the game machines.

After Jack Tramiel left Commodore in the mid-'80s and purchased Atari from Warner Communications (who had purchased it from Bushnell shortly after the development of the 400/800), Atari upgraded the 8-bit computers with the XL variants. The XLs featured more memory (up to 64K), a different operating system than the 400/800, built-in BASIC, only two joystick ports and a sleeker case. Early XLs (600, 800 and 1200) had compatibility problems with the 400/800 software, crashed too often, and few were sold.

Atari also released the 5200 game machine as a replacement for the 2600 around this time. But the new machine couldn't use 2600 cartridges at first (an adapter was later sold) or joysticks. In addition, the graphics weren't much improved over the 2600 and not nearly as good as the 400/800. As a result of these problems, the 5200 never sold well either.

By around 1985, when the XE (65XE and 130XE) machines were released, Atari had ironed out most of the OS problems and all Atari 8-bit software, cartridges and disks, was running on most of the computers. The XEs had even more memory -- up to 128K -- than the XLs, the same built-in BASIC of the XLs and a more modern look tailored after the just-released ST line of computers built around the Motorola 6800 chip (which also drives the Apple Macintosh and Commodore Amiga).

Atari also released a third-generation game machine, the 7800. The 7800, which can still be found, escaped many of the 5200's problems. The 7800 has built-in 2600 compatibility, although it does not support the 5200 cartridges. The 7800 actually allows more colors on the screen at one time than the 8-bit computers, but the resolution is the

same.

Atari even released an XE game system. It was basically a 65XE with a detached keyboard and option keys. A few cartridge games were released, but the system died due to a lack of marketing.

The XL and XE 8-bit computers represented the last stages of 8- bit development in the computer world. They ran at a then- incredible speed of 1.79 MHz, and were probably the most-advanced 8-bit machines ever.

But by the time the XEs were being released, Atari was ready to push its new ST line of computers built around the already- mentioned 68000 Motorola processor. A few years earlier, Tramiel blew a deal Atari had with the Amiga company (founded by former Atari engineer Jay Miner, designer of the Atari 800) to develop a new 68000 computer and game machine, and had to start from scratch when Tramiel's former company, Commodore, purchased Amiga.

Atari then created the ST series of computers employing the same "Windows"-type environment as used on the Macintosh and Amiga machines. In addition, the STs can run Minix, a Unix-like environment from a third-party developer.

The 520ST (512K) and 1040ST (1028K) were released in 1985. At 8 MHz speed and able to address up to 4 megs of memory, the STs were far superior to the IBM XTs and ATs and far cheaper (less than $1,000 for a 1 meg ST) than the Macintoshes. A planned 260ST never made it to distribution, since 260K was not going to be enough with the desktop (TOS) taking up too much memory. The 520ST could be used with a television, while the 1040ST needed a monitor. Both had built-in Midi support and two joystick ports (one is always used for the mouse).

Within a few years, the STfm series was released, offering a built-in floppy drive, which was soon upgraded to double-sided, double density. And almost immediately after the ST was released came the first third-party emulators: devices which could allow the ST to run Macintosh or PC software. Today, several of these emulators offer over 90 percent compability with commercial Mac or PC software.

In 1989, the Mega series of ST computers was released, offering 2 or 4 megs of RAM (Mega 2 and Mega 4, respectively), room for internal hard drives and built-in clocks. In addition, the Megas had 16 MHz CPUs, as compared to the 8 MHz STs. The Megas also had detachable keyboards, while the STs had built-in keyboards. As with the XL 8-bit computers, the Megas offered compatibility problems with existing ST software. In addition, some of the Megas could not have simple memory upgrades.

Released shortly after the Mega machines, and utilizing a new operating system, were the STe (the "e" standing for "enhanced"). The new OS (called TOS 1.4) can be installed on older STs as well, although most current software supports both new and old TOS. The STe and Mega STe machines also offer stereo sound, up to 4,096 colors and

analog joystick input. A 1040 STe runs for less than $500, and a Mega4 STe costs about $1,200.

The Mega STe also allows for editing external video sources, and can read MS-DOS disks, converting the files to Atari format.

In the early '90s, Atari purchased the Lynx handheld game machine (similar to the Game Boy from Nintendo) from Epyx, and that system has met with great popularity.

Atari also purchased the Portfolio handheld MS-DOS computer from a third-party developer, and that machine has also met great success. Although marketed by Atari, it does not support any ST software and is a PC clone-type computer.

Last year, Atari also released its ABC (Atari Business Computers) line of MS-DOS machines, although they are being distributed mostly in Europe and do not support Atari software. These, too, are PC clones.

More importantly, in 1991 Atari offered peaks at the STacy and ST Book portables, both of which do support ST software. The ST Book features a "vector pad" instead of a mouse, up to 4 megs of memory, a high-resolution (640X400) LCD display, and built-in hard drive -- up to 120 megs. Both should be available within months.

Atari's latest and hottest domestically available machine is the TT/030, based on the Motorola 68030 32 MHz machine. While little software from the ST and Mega machines is compatible with the TT, the new machine is available with either TOS or Unix operating systems. The TT can handle up to 26 megs of RAM, has a math co-processor, multiple serial ports and extra graphics modes. In addition, the TT can utilize a 19-inch monochrome monitor. The TTs start at about $1,800.

The TT, Mega STe and ST Book can all access CDROM drives, bringing Atari owners back to the front edge of computer technology.

Rumors for '92 include a 64-bit video game system, a new series of ST computers that may be compatible with the new video game system, and maybe even a TT/040. Also, Atari enthusiasts are hoping for a domestic release of the Atari Transputer Workstation, currently sold only in Europe and running a version of the Unix OS, Helios.

Once again, I am in need of someone to translate some docs for a German language Atari program into English. I also expect to have a future need (RSN) for an English->German translation project.

If you are fluent in both languages and are looking for some fame (lots) and fortune (not much) then please contact me via email or leave a message at (505) 662-7236. I'll provide details at that time.

Ideally, I prefer someone with both Internet and GEnie access.

Cheers,

## 169. Eight Track Digital Recording with the Falcon

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-03 21:43:24 UTC
From: rbuskens@muug.mb.ca
Message-ID: <1993May3.214324.3432@muug.mb.ca>
Source record: 23105

I have read one article about the Falcon in Byte. They mention that with some additional hardware the Falcon will support 8 channel direct to disk recording at beyond DAT sampling rates. The standard Falcon appears to support 2 channel recording (or one stereo track).

Does anyone know how much the hardware/software package that provides the additional capabilities costs? I am not including the costs of the large SCSI disks required for file storage, just the extra recording hardware and software.

## 170. Re: MACophiles and Amigoids, please go away

If I am not mistaken, did not Atari sue Commodore over the issue
of just who owned the Amiga?
I was under the impression that the Amiga Lorraine was to be
Atari's baby, but somehow Commodore pulled a fast one.

Can anybody here give the _real_ story and not just hearsay?

Nevermind. :)

I just read several accounts of this, and my curiosity
is satiated.

Sorry for the wasted bandwidth. Really.
I'm not pround, am I?

I have been watching this pretty carefully and last i heard was their are at
least two companys with a finished product and some more companys still
working on it. The only price i heard was under 400$, It was for the
hardware and the software. Actually though the hardware should be pretty
easy because I have been told all it is, is an adaptor from the DSP port
that has 8 line in's (and out i would assume.)

> from Warner Communications (who had purchased it from Bushnell shortly
> after the development of the 400/800), Atari upgraded the 8-bit
> computers with the XL variants.

Wrong. The XL series of 8-bit Atari computers was developed under
the old Warner owned Atari. It was an attempt to reduce the cost
of producing the 8-bit machines so Atari could lower their price
to compete with the C64.

> Atari also released the 5200 game machine as a replacement for the
> 2600 around this time. But the new machine couldn't use 2600
> cartridges at first (an adapter was later sold) or joysticks. In
> addition, the graphics weren't much improved over the 2600 and not

Again the 5200 was developed by the Warner owned Atari and it was
nothing more than a redesigned 8-bit Atari computer and used all
the same chips and had exactly the same graphics capabilities.
Atari boneheadedly moved the memory locations of the chips in the
5200 and changed the pinout of the cartridge port so that 400/800

game cartridges wouldnt run on the 5200.

At one time there were no less than 3 versions of every game Atari
put out, the 400/800 version, the 5200 version and the 2600 version.
Retailers were none too happy having to carry 3 different versions
of the same game. Developers also werent too happy to have to rewrite
and repackage 400/800 games for the 5200 when they wouldnt
have had to if Atari hadnt changed the pinouts of the cartridges
and the memory locations of the chips in the 5200.

> Atari also released a third-generation game machine, the 7800. The
> 7800, which can still be found, escaped many of the 5200's problems.
> The 7800 has built-in 2600 compatibility, although it does not support
> the 5200 cartridges. The 7800 actually allows more colors on the
> screen at one time than the 8-bit computers, but the resolution is the
> same.

Yet again the 7800 was developed by the Warner owned Atari. They just
never got it to market in a big way before Warner sold the home game
division and home computer division to Jack Tramiel. Jack didnt want
to spend the money to tool up and properly market the 7800 even though
it was a better machine (100 sprites, anyone) than the NES. Instead
he tried to recycle the old 8-bit computer technology which had long
since been paid for and came out with the XE game machines.

> In 1989, the Mega series of ST computers was released, offering 2 or 4
> megs of RAM (Mega 2 and Mega 4, respectively), room for internal hard

> while the STs had built-in keyboards. As with the XL 8-bit computers,
> the Megas offered compatibility problems with existing ST software. In
> addition, some of the Megas could not have simple memory upgrades.
>

More misinformation. The Mega STs came out in 1988 and were exactly
the same as the regular ST except for the clock, the detachable
keyboard and a pseudo expansion slot. They did not have 16mhz CPUs.
The Megas ran at 8 mhz just like the regular STs. They also did not
come with the capability to use an internal hard disk. 3rd party
companies found a way to hack them in. As for the memory upgrades,
no ST model before the STE offered the ability to perform memory
upgrades. A lot of 3rd party companies came up with hacks to allow
this.

> In the early '90s, Atari purchased the Lynx handheld game machine
> (similar to the Game Boy from Nintendo) from Epyx, and that system has
> met with great popularity.

Atari didnt purchase the Lynx from Epyx, they got it when Epyx defaulted
on some loans that Atari had made them.

> Last year, Atari also released its ABC (Atari Business Computers) line
> of MS-DOS machines, although they are being distributed mostly in

> Europe and do not support Atari software. These, too, are PC clones.

Atari canceled its line of PC clones over a year ago.

> More importantly, in 1991 Atari offered peaks at the STacy and ST Book
> portables, both of which do support ST software. The ST Book features
> a "vector pad" instead of a mouse, up to 4 megs of memory, a high-
> resolution (640X400) LCD display, and built-in hard drive -- up to 120
> megs. Both should be available within months.

No more than a handful of either machine was ever produced and both
have now been canceled.

> Atari's latest and hottest domestically available machine is the
> TT/030, based on the Motorola 68030 32 MHz machine. While little
> software from the ST and Mega machines is compatible with the TT, the
> new machine is available with either TOS or Unix operating systems.

Quite a lot of ST software will run on the TT and Atari Unix was never
released to the general public. Only a handful of copies of the Unix
OS were released and its now been canceled.

> Rumors for '92 include a 64-bit video game system, a new series of ST

Again only a few ATWs were released and those were never available in
the US. The ATW has been canceled.

>want a directory.

You sounded like a man than knew what he is talking about. Right up to the
point where you said that the Amiga has to read practically all the disk
when you want a directory. The directory is hashed, this makes the seek
a lot faster than scanning the entire disk. Only 512 bytes of data is stored
for each filename unless it is a massive file. Traversing this is very quick
as usually only the tracks near the root block need to be searched. It is
very unlikely to see file information more than 10 tracks from the root block.

Also the blitter is used to decode the track data *not* the 680x0. This makes
is very fast. Far more versatile than the outdated WD1771 could evedr be.
You can have the best of both worlds - MFM and GCR.

Steve.

Mac drives are variable-speed. And I *think* that the latest A-Max reads Mac disks on an Amiga drive (don't quote me on this :). Besides, an Amiga HD drive can read a Mac HD disk directly (I think they're the same as PC HD disks or something...)

Why don't you ask in comp.sys.AMIGA.emulations?
Now for my question.
Can a 520 ST be expanded over 1 MB? I would think so, since the 68000 can address over 1 meg. Also, can the ST's use a more advanced 680x0chip? Will it work with a multiscanning monitor? If I find a used one in the paper I'm tempted to buy it. I'm bored with my present machine.

Look at it this way, if you loose a directory block on an AmigaDOS disk, you can loose 1 file. How many files do you loose on an ST disk if a directory block gets corrupted?

This is ridiculous, The AmigaDOS OFS format is one of the most secure formats in existance.

On a related note, Why do ST's waste 160K per DD disk? I mean, 9 sectors per track, how outdated can you be?

Chris Brown

Ummm, maybe because, although the blitter is pretty good, it can't do THAT much about the speed of the disk drive? (For those that don't know, the Mac has (had?) a variable-speed disk drive, something like that used for CDs...)

Robert Brown.

How can a system that only handles one disk-format (IBM) be superior to a
system that handles numerous (including IBM) ?

What so great about CRC when it doesn't prevent write-errors?
Just wondering.

My ST can fromat from 360K to 1.66MB per floppy, depending on the
Tracks/Sector combinations... IBM can't read 'em all... ;)
However, most people will agree that the IBM is almost the standard in
disk format (I mean most programs/data are written on them!) WHY would
you want a different format unless you were planning on living under a
rock and not exploring the world! (My friend uses my ST to sector-edit
his IBM files and games).

Besides, one format makes life easier for Software Developers and
programmers alike.

Every once in a while we do swap information with people that own clones, and in that area you must have 9 sectors per 720k disk and 18 sectors per 1.44meg disk. But I normally format my disks with more than the standard number of sectors and tracks. This nicely provides security from an IBM user taking stuff snooping around my collection of disks at work. :)

I can read all of his 3.5" disks but the same is not true.

|> >>track, how outdated can you be?

The same reason you waste .5k per file, you have to store the directory
information someplace. Granted the Amiga method is more efficient for floppies
with few files on it, but it is not interchangable with other micro processors
platforms.

|> >
|> >
|> >NOTE: Atari uses the Standard IBM Format, far better than any thing that Amiga
|> >has PLUS CRC data checking...beat that ..
|> >
|> >Plus we can Format 10/11 sector disk with external programs..
|> >
|> >Facts man just facts..
|> >
|> >
|> How can a system that only handles one disk-format (IBM) be superior to a
|> system that handles numerous (including IBM) ?

Please define numerous. Are you referring to MFM and GCR, which is two
physical formats. Are you referring to the ability to handle more than
IBM 360k, 720k and 1.44meg formats, which is also more than 1 format.

How about the following:
Capacity Sides Tracks Sectors
360k 2 40 9
364k 1 81 9
368k 1 82 9
360k 1 80 9
400k 1 80 10
404k 1 81 10
409k 1 82 10
440k 1 80 11
444k 1 81 11
449k 1 82 11
720k 2 80 9
728k 2 81 9
736k 2 82 9
800k 2 80 10

808k 2 81 10
816k 2 82 10
880k 2 80 11
888k 2 81 11
896k 2 82 11
1440k 2 80 18
1449k 2 81 18
1458k 2 82 18
1520k 2 80 19
1529k 2 81 19
1538k 2 82 19
1600k 2 80 20
1609k 2 81 20
1618k 2 82 20

Now if you consider all these as formats, then Atari's support a lot more than 1 disk format under TOS-2.06. TOS 1.xx does not support the HD drives without add-on software. If you do not consider all these as formats that is your perogative, but please be a little more specific in the future.

With the add-on hardware of Spectre GCR all GCR coded disks are available, though no one has bothered to write a driver to decode Amiga disks. (The corallary to the old law of supply and demand: if there is no demand why bother to supply)

|>
|> What so great about CRC when it doesn't prevent write-errors?
|> Just wondering.
|>
|> NjE
|>

It will let you know that when you wrote to the disk that there was a media error and you can change disks and rewrite your file, so you do not have bad backups. It will also let you know if your disk has been corrupted since you wrote it. Typically I believe it is good to know that you have a problem with your media. Though you can disable write verify on your floppies I do not recommend it.

OK, pop quiz: Have you ever used an Amiga? Have you ever lost data due to the Amiga file system? 'cos I haven't, and I've been using it since '87.

> >On a related note, Why do ST's waste 160K per DD disk? I mean, 9 sectors per
> >track, how outdated can you be?
>

Far better? Far less data per disk, sure. Eleven character filenames, sure. If i wanted a PC file system, I'd buy a PC.

> Plus we can Format 10/11 sector disk with external programs..

Really? We can format 11 sectors/track from Workbench... Can you get 880k per disk with your 10/11 sector disks? Does your filesystem allow more than 8 chars +3 char extender for filenames? Eleven character filenames were outdated when the 8-bit Ataris came out (God knows why Atari chose to keep them...)

> Facts man just facts..

*heh* yeah, you take the fact that you have 720k per disk and eleven character filenames, PLUS the fact that you use the PC filesystem (THIS is an advantage? Thank you, I'd prefer trusting my data to an amnesiac with Alzheimer's), and say the ST's fs is better than the Amiga's? *sigh* go back to your sheep.

No, but the Amiga can format, read and write MS-DOS (and, of course, ST) disks.

> |> >NOTE: Atari uses the Standard IBM Format, far better than any thing that Amiga

He's referring to the ability of reading PC, ST and native Amiga disks (DD and
HD). Plus of programming your own sectors/track, tracks/disk *yawn*

[...]

> Now if you consider all these as formats, then Atari's support a lot more
> than 1 disk format under TOS-2.06. TOS 1.xx does not support the HD drives

Sure, but the Amiga can be programmed to read more/fewer tracks/sectors as
necessary, simply by adding a new device handler. I'd assume it can read all the
formats you mention (since they don't rely on variable-speed drives, and are all
MFM-encoded). Plus, of course GCR blah blah blah.

> With the add-on hardware of Spectre GCR all GCR coded disks are
> available, though no one has bothered to write a driver to decode Amiga

Amiga disks are MFM coded. And, of course, since the Amiga reads and writes ST disks very simply, why would you want to have some complex hack to allow the ST to read/write Amiga disks?

> |> What so great about CRC when it doesn't prevent write-errors?

*shrug* again, I've never had a problem with lost files; I did have a screwed-up disk once (no-name cheep one... Never bought those again :), and the OS returned a "Disk screwed. Waste it" message. So what's the big deal?

COmp.sys.atari.advocacy?

hmmm

also, re 100 sprites on 7800..

wellllllllllll :) Ever see the ou5soft demo?

counting up colored sprites, there are only 10, but counting TRUE
"sprites", there are 29 .. at least! :)

that aint too bad for a computer that actually only has >5!<

and NO, they arent all seperated vertically on the screen! 8 of them!
(the 8 3-colored ones = 24 true plaer/missles!) are all bouncing around
in the same location on the screen!

RIGHT SMACK DAB IN THE MIDDLE of >3< graphics modes per scanline!

wowowowoowoww1!!!!!! id like to see some of those games developed by
our5oft..

that reminds me, i still need to write them! :)

>OK, pop quiz: Have you ever used an Amiga? Have you ever lost data due to the
>Amiga file system? 'cos I haven't, and I've been using it since '87.

1. I have (I know this quiz wasn't meant for me, but I just can't pass one)
2. I have. Let me clarify:

In January, this year, I still owned an A1200. I was downloading a file from
a local BBS. One of the files wouldn't come. JR-Comm informed me cheerfully
' Asyncronous write error', so I quit the d/l and exited. I went to my
download directory, and tried to delete the file. All I got, was ' Sorry, bud.
No can do.' I tried to get a directory listing; no dice.

'OK' I thought, 'let it be. I try to rmember not to access that file, since it
is broken. So, I tried to run some other program (I don't remember, what), but
it also had stopped working. I tried others, many of them didn't work anymore.

So I salvaged all I could, which wasn't much, since I couldn't get directory
listings from many dirs. I couldn't use Diskmaster etc. for that reason. I
couldn't use wildcards for that reason. I just had to remember each file name,
and copy them to another partition individually. I managed to salvage about
10%. Well, a week later I didn't own the A1200, anymore.

PC's use 9-sectors, they are hardly outdated!

I can quite happily format 1 to 11 sectors per track (inclusive)
1 to 82 tracks per disk (inclusive)
1 or 2 sides per disk!

So, I can easilly format my disks to over 900K!

] No, but the Amiga can format, read and write MS-DOS (and, of course, ST)

Not without additional software though!

This was quite funny at first, but now I think it's just gone plain stupid.

In article <1993May6.182936.11401@ugle.unit.no> eyvind@Lise.Unit.NO (Eyvind Bernhardsen) writes:
>
>No, but the Amiga can format, read and write MS-DOS (and, of course, ST) disks.
>

Next time you log on, please remember to plug your brain in. You (and other Amigoids) seem to make a whole point about how you have an OS that does it all for you ... well, I'll tell you what : It stinks !!
You can read ST/DOS disks ? well so can *ANY* computer that can read a floppy. Just because those who wrote the OS thought of a specific way of representign the data, does not mean the entire computer must work with that. If I knew what the disk format was on the Amiga, I could write the driver myself. Sure, it'll be slower because I won't be using specific hardware, but it'll work just the same.
The fact that the OS does everything goes to show how incompetent you guys are in writing software. If commodore didn't put it in, then no one will !
What a strange way of thinking ...
And disk formats isn't the only thing like that. Just take the 4096 colors you guys always brag about. Well, if on my ST (Which allows only 16 colors out of 512) I can display 512 colors anyways, why don't you try having those 4000 colors without using what's provided to you. go into the lower modes, and try to write something that will allow you to have more colors and/or lines. Could YOU write an overscan for the amiga, or is setting your video controler to that pre-chewed mode the only thing you can do ?

So please, if your computer does more, it's not because it's better. It's just because others have thought it out so your poor mushy brain won't have to. Hardly anything to be proud about.

>Sure, but the Amiga can be programmed to read more/fewer tracks/sectors as
>necessary, simply by adding a new device handler. I'd assume it can read all the
>formats you mention (since they don't rely on variable-speed drives, and are all
>MFM-encoded). Plus, of course GCR blah blah blah.

wow ! what an achievement ! getting a controlleer that can access X sectors to read less than that ! Gee, you sound like a genius ! Care to tell us how to obtain such greatness ?

>Amiga disks are MFM coded. And, of course, since the Amiga reads and writes ST
>disks very simply, why would you want to have some complex hack to allow the ST
>to read/write Amiga disks?

Again, why do you think it can read them ? because the "complex hack" has
been dne by people who knew you'd be incapable of doing it yourself.

>*shrug* again, I've never had a problem with lost files; I did have a screwed-up
>disk once (no-name cheep one... Never bought those again :), and the OS returned
>a "Disk screwed. Waste it" message. So what's the big deal?
>

Never did I. But maybe if you had the check, then you could have known
before the entire disk was good for the trash bin, and saved everything
except the last one written (The one that screwed things up).

Patrick.

First, I think this topic has gone too far. I personally feel that
it does not belong here. Please take it to the .advocacy group.

Secondly, I personally do own an Commodore A4000/040 as well and I
find your generalization of "Amigoids" as people who takes prides
in havind "OS that does it all for you ..." as being rude. Maybe another
Commodore user had started the whole argument, but who knows by now.

As I said before, I think this topic should move on to
the .advocacy group COMPLETELY now.

Ah ha, that's what I've been saying for a long time, but posters at comp.sys.atari.st (are you reading this ?) seem to think anything's fair game there (grrrrrrr !).

I'd just like to make a few comments about Atari:

1. I don't care what ANY person says about Atari ST's or other computers, I think my ST is great.
2. Atari did well in 1986 to produce a neat computer. By neat I mean, when I'm programming on it, I feel at home.
3. Classic Car Syndrome: I have an original 520ST, upgraded inside, new leather seats ... etc. The suspensions the same, and I plan to widen the boot (no pun --- I'm refering to memory :).

I LOVE DRIVING IN MY CAR - madness.

Dave.

PS: 4. Slag me if you like --- I'm in a foul mood at the mo. !!
5. Support me if you like --- no harm in enjoying what you have :)
6. I support Atari, even though at the moment, it could do with a shake of its corporate shoulders ... their computers are NICE.

>IBM 360k, 720k and 1.44meg formats, which is also more than 1 format.
>

(Sigh. Could that really be misunderstood.)
The Amiga reads both ST/PC-disks and off course Amiga-disks. In addition you can mount various filehandlers and read various Unix-format disks. OK ? Soon a Mac filehandler will be available as well. And the beauty of a filehandlers is that it's totally transparant. Applications will never know that they just loaded a file from a PC/UNIX/Mac-disk.

>With the add-on hardware of Spectre GCR all GCR coded disks are
>available, though no one has bothered to write a driver to decode Amiga
>disks.

Off course you can buy new hardware. But I was comparing the two systems as is, and with that in mind, there shouldn't be (but still is) much discussion about which is the most flexible.

>|> What so great about CRC when it doesn't prevent write-errors?
>|> Just wondering.

>It will let you know that when you wrote to the disk that there was a
>media error and you can change disks and rewrite your file, so you do

>corrupted since you wrote it. Typically I believe it is good to know
>that you have a problem with your media. Though you can disable write
>verify on your floppies I do not recommend it.
>
Just as if the Amiga won't let you verify disks. And still, if you for some obscure reason shouldn't trust native Amiga-format, then use the "superior" PC-format. That is the beauty of having a choice.

And it really sounds suspect when at same time as talking about disk-security, boosts about beeing able to format disk 81/82 through some 3-party disk-hack. I guess you'll continue doing that the day your disk-head gets stuck.

I may not be right on this one (so no flames please), but i belive that Mac disk drives spin at different speeds depending on where the disk head is (ala CD-ROM).

If it was MFM or GCR the Amiga would be able to read it.

Source record: 23044
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

Well, I think I should apologize for my previous post. I was not quite aware of the kind of people I was refering to.
After many hours of wondering why they even bother posting here, I decided to make a little trip down to their place : comp.sys.amiga.advocacy.
It was, how should I say ? weird. Yes, just plain weird. There were a number of threads (Not too many). The main one was debating between the Amiga and PC's, almost along the same lines as here. Another was criticizing the QUERTY keyboard, and others were comparing "old technology" with the new one (Like the PET and C64 !!). Others were wondering who in their midst will be the last one to post on their group. One even posted an article (Subject : Amiga is #1) and says quite frankly that he posted it so it'll start a new flame thread, and behold ! It's working !!
But one thing that *really* shocked me, was to see that there was no thread on the ST! Sure, it may be that during a Amiga-PC debate, one would go "Oh, and the ST sucks by the way" out of nothingness, but there were no major attacks. So, we just happen to have amongst us those frustrated ones who feels they cannot let a platform untouched by them.

I'm sure not all Amiga owners are like that. I know some who are very aware of what the different systems can and cannot do, including their own. I think we're just unlucky. I mean, here they are, posting in our group about how their new A1200 (Which came out when ? less than a year ago ?) with our 520ST (First released back in '85, so the design is even older).
They might as well be comparing the ZX81 with the latest from SUN. Has anyone noticed that they *never* flame about the TT, just because they know it's more powerful than the ST, and thus they can't say much bad about it?

And I will reiterate my previous post saying that the power of a computer is not the same as that of the OS it has. I totally agree the ST's desktop sucks real bad, but there are alternatives. If your Amiga OS allows you to read all disk formats, then good. Ours doesn't simply because we never needed it, and so no one ever wrote anything to do so. Generally speaking, the ST does not have as much as the Amiga when you buy it, but it doesn't mean you *can't* have it, just that you're not forced to pay for something if you're never going to use it. How many Amiga users run their WP in full 4096 color mode ? OK, maybe they will use it for games, but that's about it. And if you don't want to play games, you bought an expensive piece of hardware for no reason whatsoever.
Sure, you'll say "But if we want to use something, we don't have to go anywhere, because it's already in there". I agree. But on the ST, if you wanted it from the start, you would have bought the required hardware along with the machine. And what you don't need, you don't pay for.

I've had my ST for 6 years now, and I still like it a lot. It seems, however, that most Amiga owners feel they have to buy the newest release everytime. Many of you say you've had (And probably still have) the 500, 3000 and now the 1200, plus all the others whose number I don't remember (Why can't Amiga get those number to grow, and not jump up and down randomly).
If the computer had indeed been well made, you wouldn't have to change it every year. No one with an ST (At least no one with a sane mind) would have sold it to get the STe. Not enough difference. Buying a TT or Falcon is another matter. They're way more powerful than the STfm, and thus are good reasons for changing.

Anyways, I'm sick of those wars. They're stupid, pointless, and make it look like all Amiga owners are nerds, when that really isn't the case. Just a couple of them (There are Atari nerds I'm sure, but they keep silent)

Patrick.

Congratulations. This post has got to be THE most incredibly brain-dead drivel I have EVER read. I just hope to God Dr. Kevorkian drops by your wing of the asylum.

> So please, if your computer does more, it's not because it's better. It's
> just because others have thought it out so your poor mushy brain won't
> have to. Hardly anything to be proud about.

I think this sums you up fairly well. What are you doing with an ST? I mean, it has BUILT-IN routines, right? I mean, you wouldn't be caught DEAD calling an AES routine, now would you? No, I guess you'd rather program the 68000 in microcode, using a 5v power supply and pencil and paper (wel HELL what do you want memory chips for?)

> Again, why do you think it can read them ? because the "complex hack" has
> been dne by people who knew you'd be incapable of doing it yourself.

I assume, of course, that when your ST boots up, it uses your own disk loading routine, hand-fed in at boot time by you setting individual bits of memory.

> >*shrug* again, I've never had a problem with lost files; I did have a screwed-up

nice?

ok... now to my letter... ;-)

Hi!

I just popped into this newsgroup to see how everything is going..

Now to my question... I read on the cover of ST User / ST Format that
the ST sold 150.000 units recently..

Is this true?

Has this something to do with the lowering of the price on ST?
Here in Norway you can pick up ST's now at a very good price..

well..well.. :-)

Are there beeing produced many new games on the ST nowadays?
If those rumors about St's beeings sold are true, it would renew
developers interest in games-programming on ST..

I just remembered reading in one of my amiga mags that Dino Dinis Goal
were advertised for the Amiga and the ST...
(Advertised for no other than those two... but versions will come for other
machines i think...But looks like Amiga/St get it first.)

Greetings from a friendly Amiga-user .

>setting your video controler to that pre-chewed mode the only thing you
>can do ?

You REALLY need an education. Dynamic hires, SHAM, PCHG, and assorted other display tricks. GO back to your 512 color atari and enjoy your ignorance. If you really think doing everything yourself is such an advantage, why dont you throw out your 1040 or whatever and get an atari 2600... you dont need a keyboard of course, just use the joystick buttons... only incompetent people need a keyboard. duh.

>So please, if your computer does more, it's not because it's better. It's
>just because others have thought it out so your poor mushy brain won't
>have to. Hardly anything to be proud about.

Whatever dude.

>wow ! what an achievement ! getting a controlleer that can access X sectors
>to read less than that ! Gee, you sound like a genius ! Care to tell us
>how to obtain such greatness ?

Easy, GET A CLUE. Do you know anything about the Amiga's floppy disk system? With all your bragging, I bet you couldn't even write an Amiga MFM disk loader.

>Again, why do you think it can read them ? because the "complex hack" has
>been dne by people who knew you'd be incapable of doing it yourself.

This incompentent tint again. Why do you use TOS? Why not write your own OS, since otherwise you'd be "incompetent".

PC's are outdated since their introduction. If you want to defend an ST by pointing out its similarities to a PC you're a long way from home.

## 215. Advocacy groups. Was: Re: MACophiles and Amigoids, please go away

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-07 21:31:20 UTC
From: rb10006@phx.cam.ac.uk
Message-ID: <1993May7.213120.2455@infodev.cam.ac.uk>
Source record: 23049

(Please note: have changed title to something more relevant, and altered groups).

In article <1993May7.141841.13081@thunder.mcrcim.mcgill.edu>, bpat@cs.mcgill.ca (Patrick BETREMIEUX) writes:

[lots of stuff about comp.sys.amiga.advocacy deleted]

Yes c.s.amiga.a is pretty weird, mostly due to the efforts of three people, none of whom own Amigas...

Marc Barrett (Mac)
Dan Stephenson (PC)
Jerry Schekel (PC).

Now, you Atari people may object to us Amiga owners posting here, because it messes up your newsgroup, but you can't object HALF as much as we do to these people...

Next time you take a look at c.s.amiga.a, don't look at anything posted by them, or anything posted as a follow-up to anything posted by them. The group will instantly make a lot more sense, and become a lot less "weird". (I know it's difficult to sort out which are the follow-ups, but have a go... :-) )

Anyway, just hope that people like that never discover your newsgroup. At the moment, it's quite nice here :-)

I apologise for the lack of relevence to the newsgroup, but someone DID post here criticising c.s.amiga.a. I just wanted to point out that it wasn't the AMIGA owners who make it like that.

Thanks for listening.

Robert Brown.

^^^^^^^^^^^^^^^

None, HAM is for graphics work, and it's very good at it. (Now does 262144 colours.)

|> And if you don't want to play games, you bought an expensive piece of
|> hardware for no reason whatsoever.

I use mine for wordprocessing, programming, graphics and just because I enjoy using it. I very rarely play games. I don't consider this to be no reason whatsoever.

|> Sure, you'll say "But if we want to use something, we don't have to go
|> anywhere, because it's already in there". I agree. But on the ST, if you

|> every year. No one with an ST (At least no one with a sane mind) would have
|> sold it to get the STe. Not enough difference. Buying a TT or Falcon is

And there was not enough difference between the 500 and 600, or the 500 and 2000, or the 1200 and 4000 to upgrage. Of course, going from an A500 to an A1200 is another matter. They're way more powerful than the A500 :-)

|> another matter. They're way more powerful than the STfm, and thus are good

But don't you see? Sinclair, Ricardo (aka 'Raist'; or is it vice versa?), Eyvind and the rest can't annoy as many people by posting to .advocacy; there's still too little traffic in the group to attract their sort of pissing contest. Of course, they cross-post deliberately, so that .advocacy readers can be doubly annoyed. Anyway, I've set the Follow-up to .advocacy; we'll see ...

Ok, whatever.. but your previous post was full of drivel about Amiga
programmers or whatever being inferior because they can't write MFM
disk loaders. What kind of nonsense is that?

>I've had my ST for 6 years now, and I still like it a lot. It seems, however,
>that most Amiga owners feel they have to buy the newest release everytime.

Exactly why people upgraded from the 500->3000->(4000/1200). I'm sure
there are many atari users who went from 520ST->TT->Falcon, or will go
that route.. no difference.

> [story deleted]
As have I. I had problems with disks on my old 1000, when I actually needed
the floppy. I rarely use my A3000 floppy drive so I have few problems.
But then again, who cares about floppy drives? I use them once to copy things
to HD and once to back up (o.k., I never back up, I have nothing important.:)
BTW, I could usually recover stuff with Disksalv on the 1000.
--
Jeremy Konopka konopkjt@cs.uregina.ca
P.S. The Amiga 1000 drive did seem slow. It was also the old 'gronking'
variety.

*ahem* objection... I try to set the Newsgroups: to just .advocacy, I just forget sometimes (for instance when some damn ST-ite tries to tell me that a computer with MORE features is WORSE than a computer with LESS features, and that coincidentally anybody who uses the computer with more features is brain dead).

> and the rest can't annoy as many people by posting to .advocacy; there's still

Yep, I didn't change it (although this should, of course, have gone to all the atari groups APART from .advocacy... *sigh*)

So bloody true. My suggestion: if your newsreader permits it, find out how to make a kill file, and chuck these three into it!

>Anyway, just hope that people like that never discover your newsgroup. At the
>moment, it's quite nice here :-)

Wishful thinking... a while back there was a cross posting by Barrett to c.s.atari.st and a few others... the rsulting mess was quite wasteful really. This was also the main reason mr B. ended in my kill file.

## 226. A matter concerning lexicor and cybercube

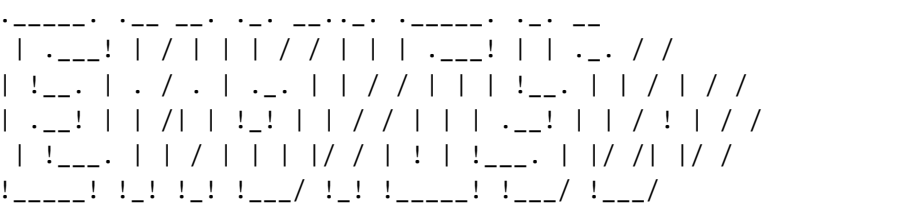
Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-10 00:51:59 UTC
From: drnibble@bigwpi.WPI.EDU
Message-ID: <1sk8vf$ksd@bigboote.WPI.EDU>
Source record: 23061
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.tech

GEM-View is a SHAREWARE Product that according to Mr.Dieter Fiebelkorn has NO SINGLE SOLE EXCLUSIVE DISTRIBUTOR anywhere. However Cybercube seems to claim otherwise and is trying to make Lexicor Software look bad as they have announced to release GEM-View to the SHAREWARE Terms with Mr.Fiebelkorn of the program GEM-View which was direct registration with Mr.Dieter Fiebelkorn and FREE distribution of the SHAREWARE version 2.30 >=.

There has been some inclarity about the situation of GEM-View in North America. This is what Cybercube basically had to say to this in GEnie.

**********

Category 7, Topic 33
Message 39 Fri May 07, 1993
CYBERCUBE (Ralf) at 18:25 EDT
---------- OFFICIAL ANNOUNCEMENT ----------
N E W D I S T R I B U T O R F O R



---
Cybercube Research Limited, Canada has acquired the exclusive rights to distribute Dieter Fiebelkorn's GEM-View in North America.
Effective immediately, Cybercube Research Ltd. will solely handle all customer support, registration, upgrade and marketing related issues.
The existing versions of GEM-View will remain SHAREWARE while the new versions will only be available as a COMMERCIAL product.
For more information about our extensive upgrade policy, a full list of the new and extended features, the next release or pricing simply refer to our upcoming GEM-View press releases.
If you have any additional questions, please send your e-mail to CYBERCUBE or contact us at:
Cybercube Research Limited
126 Grenadier Crescent
Thornhill, Ontario,
Canada, L4J 7V7
Tel. (416) 882 0294
Fax (416) 886 3261
BBS (416) 882 5895
GEnie CYBERCUBE
We would like to thank all GEM-View users for their continued support

and look forward to a exciting and new co-operation.

**********

This statement is incorrect and Mr.Fiebelkorn has not approved of this statement at all. GEM-View will be available and can be registered by BOTH CYbercube AND Lexicor Software for their customers (Lexicor will simply take off the burden of registering to Germany singlehandedly but it is still as if YOU PERSONALLY are registered for GEM-View).

I believe Cybercube owes Mr.Dieter Fiebelkorn an apology for both Mr.FIebelkorn and Lexicor Software for the attempted embarrasement and false press release to all the Atari Users.

Lexicor Software will continue to serve its customers with the best possible service, and if told otherwise by Mr.Fiebelkorn, and only Mr.Fiebelkorn will freely bundle GEM-View till to version 2.30

Yat Siu

Actually, the 800 (apparently) also started with 8K RAM. It was also packaged with the 410 cassette recorder and the Atari Educational System Master Cartridge. They later took away the latter 2 items and added 8K more memory. I know this because of a notice in my Atari Manual mentioning the change.

>
[...]

>released. Both computers could also use the 2600 joysticks, and had
>four joystick ports as on the game machines.

Wasn't "Monkey Wrench" a right-hand cartridge? Plus another cartridge that included a battery-backed clock, if I remember.

Also, what did happen to the STacy (the laptop computer, if I remember)? Last I heard it was being sold to music stores and such and that it actually gained a certain amount of popularity.

## 228. GEM-View distribution (was: A matter concerning lexicor and cybercube)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-10 12:06:26 UTC
From: fiebelko@bonny.informatik.uni-dortmund.de
Message-ID: <1slgg2INN89s@fbi-news.Informatik.Uni-Dortmund.DE>
Source record: 23063

Hi folks,

For the first: NOONE has a contract of "exclusive rights for distribution"!
"exclusive rights for distribution" meens: If there is any person/firm
which should have it, no other can selling the programm (in this part of
the world)! !!!!!BUT ALL EXISTING VERSIONS CANNOT SALE (it's Shareware)!!!!!

Second: GEM-View is SHAREWARE up to version 2.24 and anyone can get it
from GEnie without pay for it. (A commercial version don't exist in this
moment!) The SHAREWARE-Version can be copy free and MUST be registered,
if it is used, by myself and the shareware-fee must paid to me. To make
it easier for users in USA/Canada, Cybercube can answer user-questions/
user-requests and make a list for all the persons, who are interest in
registration. I will get the list and the money; the registration will
be made by myself. This is a user-support not a "rights for distribution",
i think! Lexicor has not this right of user-support!

If there is any, who asserts, that no shareware fee must be paid for the
existing versions of GEM-View (less or equal 2.24), is wrong!
If you use GEM-View, you must pay the shareware fee (DM 30,-- or US$20,--)
to me, the registration will ONLY made by myself!

!!!!!!!!!!!!!!!!! ALL OTHER ANNONCEMENT ARE WRONG !!!!!!!!!!!!!!!!!

NO DISCUSSION ABOUT RIGHTS OF DISTRIBUTION FOR GEM-View IN "comp.sys.atari.st".

This is a warning to Lexicor and Cybercube!

>
>Not without additional software though!

Hel-lo??? MS-DOS file reading/writing is *included* with the operating system!!! Do you know what you are talking about?

Anyway, this is all a moot subject. First of all, people (and supposed engineers, no less) are using a very generic term - "disk format" - and are using it in not quite its true meaning. What people have actually been talking about when discussing sectors per track, etc, is more like *DRIVE GEOMETRY* - there are a finite # of drive geometries, and are all hardware dependent. This is what is so baffling. The ST and Amiga use the same #$@#%#$ kind of disk drives, so how can there be any argument here??? Amiga and ST drives at the hardware level read and write exactly the same (MFM) and at the same speed! Okay, so that's settled.

Now, we have the other part of what is all under the generic term of "disk format" and that's the filesystem. Here the two are very different. Each has it's advantages and disadvantages.
Here's what bother's me though: The ST users are trying to defend the fact that they are locked into one filesystem, namely an MS-DOS type filesystem. Why has no one on either the ST or PC ever come out with a new filesystem that allows longer filenames and whatever other nice features you might desire? What is do difficult of writing a new filesystem that reads both the new disks and the old 11-character filename disks? (Beats me.)

Now, for those who love the safety and compatibility of your MS-DOS-type filesystem, there can be no argument against the Amiga since you can easily mount the MS-DOS filesystem on all your HD partitions, all your floppy drives, etc. and you can go on your merry way using MS-DOS filenames for all your files and programs. What seems to be the problem here? How can you criticize the fact that the Amiga allows BOTH filesystems to be mounted on any # of devices simultaneously and will recognize what disk is inserted automatically? If you hate the Amiga FS, just boot it and use the MS-DOS filesystem! No big deal....And you'll *Still* be able to read your friends' Amiga disks with no problems.

Now, I realize the concept of inserting a disk and having the machine automatically figure out what disk is inserted is a foreign concept to ST and PC users (Mac, NeXT, Amiga, and some workstation users are quite blessed with such technology) but that's not my problem, is it?

Case closed.

Not really. The ST under MiNT can handle multiple file systems, including the Sierra CD-ROMs using .XFS configurators. Your post makes good sense, but your lack of knowledge about newer developments in the ST/TT/Falcon OS development is obvious.

So... you sit there doing dir all day? File opens and other useful operations
are orders of magnitudes faster under AmigaDOS than most file systems.

Also whats wrong with using Directory cached floppy disks?

Do YOU know what you're talking about? MiNT nee MultiTos supports loadable filesystems. One of these is a minix file system, similar to a unix filesystem.

SUNNYVALE CA: In a groundbreaking move, Atari Corporation and Commodore have announced a joint venture into the personal computer arena. The former competitors claim to have realized the futility of trying to compete against each other for "niche" markets and have decided instead to "team up and have a go at Big Blue."

The new computer is called the "Atiga", and is said to combine elements from both the ST and Amiga lines, as well as several new features. For starters, the new machine will be based on the Intel 80286 processor. "The 68000 family is dead," claims Atari's Bob Brodie. "The original plan was to make the Atiga PC compatible, but about halfway through the project Jack Tramiel decided on a new operating system based on the HP-41 handheld calculator." Text is entered in a modified RPN (Reverse Polish Notation) in which words are entered first and then all punctuation is added at the end of a sentence. "It's much faster when you get used to it," claims Brodie.

In addition, the Atiga is said to borrow sound and MIDI capabilities from the Amiga line and graphic capabilities from the Atari ST. "We wanted to build on the Amiga's success in the music market and the ST's popularity with video production companies," said a Commodore spokesman.

The Atiga will be available in two configurations. The first is a one piece model with integrated monitor, keyboard and CPU. The one piece model ships with no RAM, though an Atari spokeperson mentioned that he thought that RAM boards might be provided by third party manufacturers at some future date.

The second configuration features a CPU and a unique Direct To Brain (DTB) interface. Although still in early testing, the DTB interface is connected to the user via two probes and I/O is established through a combination of brainwaves and biorhythms. One probe is attached to a collar fitted around the user's tongue, but spokepersons would only giggle when asked where the second probe was connected. When asked about the RAM configuration the spokespersons replied "Yes, that's correct," and broke into hysterical laughter.

In an unusual move, the two companies have announced the availability date of the computer to be three weeks ago, with production scheduled to begin by next fall. In the meantime, a media blitz is planned to start immediately with print ads in supermarket tabloids and video spots in trailers for adult videos. "We're really excited about this one," said the Commodore spokesperson. "Yes sirree Bob." "What?" replied Brodie.

There _is_ a new PC file system called NTFS, or New Technology File System. It comes with (not surprizingly) Windows NT. 256 character file names that automaticly generate an 8.3 file structure so any machine on the network that cannot read NTFS can access the data. Built in security, to the point that not even if you delete the file, with the data still there, can a non-owner access the info.

Unfortunatly, it's bundled with the biggest OS dissapointment this century. [Even the March beta is _really_ sad. Like running X-Wing on a DX/2 66 slower than a 286/10. <sigh>]

Since most Atari owners are into midi I'd say there is a futre there.
It may not be the one for you but it is one for musicians.

> The A1200 is highly expandable with a trap door underneath to add a coprocessor
> board or other goodies...Pretty soon we will beable to add a Mac
> emulator(color!!!)......

Oooooo a trap door on the bottom is soooooo much more technically
advanced than opening the case to add the math co-processor. The 1200
must even more expandable than a 2000, 3000, or 4000 which Commodore states
as being expandable, not highly expandable.

And what exactly is a goodie, perhaps a DSP chip, perhaps 8 channel 16 bit
PCM record/playback.

Don't look now but good old D Small has been beta testing for the next
version of Spectre GCR, and if it hits the market first...

>
> Wise up...Soft logic has moved on to bigger and better things...

Yup they sure have, latest word is a port for Windows :)

Besides you don't want Atari computers to have the same software as your
beloved Amiga there might be more money for Soft Logik to make PageStream IV.

I like running PageStream on my TT. It really screams on a 32mhz 68030,
though it is no slouch on my 16mhz ST.

> "I still want a CDROM for my A1200"

I already have one on my Atari TT and now on my ST also :^P

Excuuuse me, but the 1200 has this little slot on the side... Can you say PCMCIA?
(No, neither can I. But you know what I mean :)

> "I still want a CDROM for my A1200"
I still want a harddisk for mine... A BIG WUN *heh* (wouldn't have minded the
Falcon's SCSI-II, though... *sigh*)

>The new computer is called the "Atiga", and is said to combine elements
>from both the ST and Amiga lines, as well as several new features...

Fortunately, the merger between Atari and Commodore has broken up
after furious debate over what the machine should actually be called.

Atari officials want "Ataga" and will settle for "Amari", but
Commodore demand "Amiri", or "Atiga" at the very least.

Meanwhile, IBM have announce the final name for their Pentium-based
machine. It will be called "Computer". VGA will be renamed to "Graphics".
Simultaneously, Microsoft have renamed themselves "Software", MS-word
is renamed "Word Processor", and "MS-DOS" is renamed "OS". Spokespeople
from both companies have stated that the name changes are to avoid
confusion in the marketplace, since the new names are the more common
terms.

Your beloved trap door is nifty, but not that great. The Falcon
has a direct parallel processing port, capable of supporting two board right
now that beat the snot out of anything available for the A12. Like a 486sx
that actually uses the F030's hardware, and can be run simultaneously with
other Falcon Apps. And the Mighty Sonic 32 [I think that's what it's
called...] 32 MHz 68030, with 32 (!) SIMM slots that can hold up to 128 megs
worth of RAM. Now, before you start throwing that 50MHz 68030 for the 1200
board around, and say it can also supprt 128 megs ram, I will agree with you.
However, you have to get it in _ONE_ 32-bit SIMM. [That's one damn big SIMM]
Also, the Falcon board has a built in VME expansion board, for say, that new
CyReL graphics board [2048x2048x256, or 1024x768x16.7m]

Maybe.

Color Mac emulator, and you're happy about this? At least the ST mac emulator
doesn't requre you to get a whole new drive to read Mac disks.

> Wise up...Soft logic has moved on to bigger and better things...
"Wise up."? Interesting phrase, considering who it's coming from.

>
> "I still want a CDROM for my A1200"

Why? You's still have to get a SCSI controller. Oh, did I mention that that
too takes up your precious trapdoor. You can only have one.

So, if you want everything the falcon has, or can get if you add that MS32
board, you need to get at least a 32MHz 030, can hold 128 megs RAM, battery
clock, FPU socket, video capture board (that CyReL can do it with a little
attachment), SCSI-II controller w/ DMA (not bloody likely), a processor direct
expansion bus, and SOME DECENT SOUND HARDWARE FOR ONCE! all on one little "trap
door" card.

Hmmm, I think the price of that Mega Board is a bit out of _your_ price range,
so just give it up. Don't argue Amiga tech with an Amiga tech. You'll loose.

Just something to think about.

|> door" card.

You are also forgetting PCMCIA. You can plug anything from PC emulators,
removable harddisks, even RAM (16 bit, so we can experience the 'Falcon effect'
:-)

|>
|> Hmmm, I think the price of that Mega Board is a bit out of _your_ price range,
|> so just give it up. Don't argue Amiga tech with an Amiga tech. You'll loose.

But the A1200's trapdoor is a full processor expansion bus. It also connects to
the rest of the system via a full 32 bit databus, not like the crippled 16 bit
effort in the Falcon. Also the new emplant emulation card will soon have a Falcon
module, allowing Amigas to run Falcon software.

Dont forget that you can also but an A4000/030 now for a very reasonable price,
which comes with a 25MHz 68030 (on a 32 bit bus!) and has multiple Zorro III
slots which, I'm, afraid blow the poor Falcon away when it comes to expandability.

This pro-Amiga post was a pretty useless flame.

First of all, the Falcon 030 has a CPU direct slot that, while it is not apparently a full 32 bit slot, it does offer expansion capability. It also has a seperate socket for a 68881/2 math coprocessor. And SCSI-2. And the DSP out. Despite being stuck in a 1040ST-style case, it's got a lot of slots & sockets.

I love the quote about the Mac emulator... I guess that since the A1200 does not have it available yet, it is still vapor. When it ships, then I'd mention it. Otherwise, it's just as much vapor as the Gadgets by Small Mac emulator for the Falcon.

The bottom line is that right now, the market has not slanted towards the A1200/4000 or the Falcon 030. And personally, I think it's ridiculous for an Amiga owner to flame the Falcon for having no future when the PC and Mac are making mincemeat out of both platforms in the marketplace.

I'm also wondering about the price/performance of the A1200 and Falcon. I've played with both, and I get the impression that for users who understand a bit about hardware, the Falcon will hold slightly more appeal, mainly due to the built-in 56001 DSP and the SCSI-2.

Regardless, it's unlikely that either machine can sell to a new user who is aware that DOS & Windows are dominant, and does not have the time or in inclination to become involved in learning about a system where a vast

amount of the thigs they learn will NOT help them with DOS or Windows.

I can't hold back this flame... but... where is Cubase Audio for the A1200? :)

## 250. Best feature of the Atari line is GEM.

Newsgroup: comp.sys.atari.advocacy

After watching the A1200 vs. Falcon flame-fest go on and off, I'm wondering if anyone else has noticed that as far as being tied to the hardware, it seems the Amiga is in that situation moreso than the Atari. I have a friend with an A500 + DCTV + 5MB + tons of video sofware & genlocking. His problem is simply that he cannot run the video programs that work on the stanrd A500 under DCTV, and those same programs seem tied to the hardware. The best they can offer is the HAM modes, including the newer 640x400x4096 mode which I think is pretty impressive for a machine of the Amiga's vintage. :) But the one thing the ST seems to have over the Amiga line in terms of video is that there appears to be greater device independence in the packages that use GEM.

The big question I wonder about, and I know the Amigoids will flame this, is whether or not this observation is correct.. can an Amiga user do what an ST owner can do, i.e., go out and buy a video board with a driver and watch all the programs that ran on their stock machine work with this new board provided they go through the OS services?

Not surprising. DCTV sits outside the computer and converts a standard Amiga
Hi-Res screen into one with more colours, but less definition. As far as the A500
is concerned it doesn't have any extra hardware.

The new HAM modes go up to 1280*512*262144, which is slightly more impressive
than 640*400*4096 (Although that mode exists as well.)

The vast majority of boards for the larger Amigas (A2000,3000,4000) will run old
software on their enhanced screens, provided they use the OS routines.

The answer to that question is definitely yes. Since AmigaOS 2.0, it has been possible to install "monitor drivers" in the system (ones are provided by default for TV/monitors, Multiscans, VGA, etc.), and any program which uses the "display database" (basically a list of all the available modes) will be able to open screens in the new resolutions.

You are right that the Amiga WAS tied to the hardware in release 1.2/1.3, but since then, Commodore's engineers have been removing the dependence. In a forthcoming release (4.0), there will apparently be completely re-targetable graphics, but exactly WHAT this entails is still the subject of debate.

Just out of interest, could someone post/e-mail me a short, concise, non-biased account of how GEM is device-independent? I'd like to compare notes. Thanks in advance.

(BTW, the new higher resolutions of HAM mode are 1280x512x262144 and 800x600x262144... :-) )

Robert Brown.

PCMCIA was an excellent choice for a general-purpose slot on the A1200...
sine it will be an industry standard connector. I personally think it
was smart, but..... i think they should have had built-in SCSI.

(fast hard disk access is always a + )

Whoa. What is this "emplant" emulation card? And how are they going to
emulate the Falcon on an A1200 which, if I remember correctly, does not
even have a 68030, will be running a multitasking TOS that has memory
protection, and has graphics capabilities that might not be "emulatable",
like the True Color mode? (I know HAM-8 is capable of more colors, but can
a desktop or application run on a 14mhz 68020 machine tolerably under an
emulator to do 65536 colors, even with the nice graphics co-processor?)

I'm going to love seeing how an emulator would handle the DSP and the
way many sequencers for the ST hit the MIDI hardware.

(in fact, if they add the cost of a DSP to the card, it'll probably cost
as much to get a real Falcon...)

>Dont forget that you can also but an A4000/030 now for a very reasonable price,

The A4000/030 is a professional desktop computer. The Falcon 030 as it stands
is just an "entry level machine".

Atari's track record on expandability sucks... but be fair... the Falcon 030
is just a home machine. But it's one hell of a nice box...

(I also wonder how much does an A4000/030 cost? And how many Mac Centris 650s can you buy for it? Both Atari and Amiga need to worry that Apple is using 68040s (even if they are "just" the LC version) in machines we can buy for $1600 or so in the USA)

The thing I am wondering about is the software itself... are we talking about DTP applications, Word processors and applications of that nature? The one thing I find interesting is that, for example, the software for many of the video cards for the Amiga in pro-video use are apparently tied to the hardware of the cards they are designed for. e.g., Toaster software works on Toaster hardware, DCTV w/ DCTV hardware, and so forth and so on.

How much software is that portable is the big question I guess... in the Atari world, I notice it took a lot of head banging to get people to use the OS, but I think that began to get cleared up when the TT came out.

(i assume similar things happened when the A3000 came out)

HAHAHA... isn't it funny how when A1200 owners get their backs up against
the wall, all they can do is compare a Falcon to an A4000!!!

If you want to do that, then put you puny 25MHz A4000 up against
my TT (with a 32 MHz cpu!).

## 256. Re: MACophiles and Amigoids, please go away

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-14 06:47:01 UTC
From: huots00@tohi
Message-ID: <huots00.737362021@tohi>
Source record: 22991
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

-> If your Amiga OS allows you to read all disk formats, then good. Ours
-> doesn't simply because we never needed it, and so no one ever wrote
-> anything to do so.

YARK!! Atari world is so closed that nobody needs to exchange with
other platforms ??

Today, it's impossible to live in such closed world ...

... if you just play games, ok, no problem !!!

But, if you want to print on a laser printer service running on a PC, or
you need to include an EPSF drawing from your friend that have a Mac, in
your word processor ... if you can't , big troubles !!!

And, such things are very very frequent !!!

Just a simple example :

When i am doing FTP, i ALWAYS copy files directly form the Sun's floppy to
a MS-DOS Disk, and i read them directly with my Amiga ...

I think that all people that needs to do many normal things with their computer
*AVOID* to buy a ATARI ST/STE/TT/FALCONVAPORHARDWARE 'cause they know that
computers can't ...

... other that buy ATARI don't care what others do, they don't know frequently
what AMIGA/MAC/PC do !!!

-> How many Amiga users run their WP in full 4096 color mode ? OK, maybe
-> they will use it for games, but that's about it. And if you don't want
-> to play games, you bought an expensive piece of hardware for no reason
-> whatsoever.

Very ridiculous !!! ;-)

The coprocessors of Amiga aren't so expensive ...

... and, see what xVGA do, and look prices. Look also WHO HAVE a VGA on PC.
Almost anybody ...

i didn't think that Amigas will be less expensive if you eliminate the
4096 modes ! ;-)

That's a very good idea to C= for have place such possibilities in ALL
AMIGAs. The software makers didn't ask them "will i use these modes" ?
THEY USE-IT !!!

And, in opposition to ATARI computers, all these colors on AMIGA have
professionnal applications and using. I think you know well DESKTOP VIDEO
and MULTIMEDIA.

-> But on the ST, if you wanted it from the start, you would have bought
-> the required hardware along with the machine. And what you don't need,
-> you don't pay for.

HEY! ;-) 4096, and now 16 million of colors ar NORMAL configurations today!!!

Perhaps not on ATARI, but on ALL other platforms you need only some peanuts
to get thems ... ;-)

I did not think that computers will be very less expensive without it.
The difference isn't so big to not get these colors ...

... and on ATARI, if you get these card ... how many softs support them??

-> I've had my ST for 6 years now, and I still like it a lot.

I have an Amiga since 1986, and i have choose it considering also ATARI.
But it was definitely CLEAR to me that ATARI ST offers ALWAYS less than
Amiga computers, on Hardware AND on OS.

When you try an Amiga ... you didn't want to exchange it with a PC, a MAC
or a ST! ;-)

You get many things unavailable on others computers, and you won't loose them.

-> If the computer had indeed been well made, you wouldn't have to change
-> it every year.

Very stupid! ;-) NO COMPUTER IS PERFECT (don't try to say me that your ATARI
is perfect ... i can go with an AVALANCHE of cheap things on it), and all
users have many advantages to upgrade their systems !!!

Seriously, that's very very alarming for ATARI users to see that ATARi isn't
able to release his computers ... it's for when the FALCON ??

And, nobody change is Amiga at every year ....

... i have change mine this year, form an A500 that i've owned since 3 years, toan A1200
that i will surely keep 2-3 years.

All new features, as AGA graphics processors on A1200 and A4000 are very
attractive to many users, and it's normal for them to want buying one! ;-)

-> Buying a TT or Falcon is another matter.

TT have technologies of yesterday ... not interesting at all !!

(YARK !!! What a PIZZA BOX !!!!!)

Falcon, can you buy one PRESENTLY ???

Falcon is technology of tomorrow for after-tomorrow ... with promises to
be relaesed yesterday!!!

The important thing is to be satisfied with youe computer, same as you said!

But, try seriously an Amiga 1200, and i sincerely think that you will never want your ATARI again.

-> i think they should have had built-in SCSI.

-> (fast hard disk access is always a + )

The SCSI in my A1200 is enough fast.

Before seeing a1200, i was also scepticic about speed of ide, and after
see it i haven't doubt about it : it's correctly fast.

Salut
Sylvain.

>
> Whoa. What is this "emplant" emulation card? And how are they going to

Emplant is some STUPID acronym; the card is a generic emulator... You add modules to the base Emplant card, and it emulates a Mac, PC, whatever. Probably cost-efficient, if you think about it :) Not that I WANT to use a PC or (God forbid) a Mac, but if you do, it's there.

> emulate the Falcon on an A1200 which, if I remember correctly, does not
> even have a 68030, will be running a multitasking TOS that has memory
> protection, and has graphics capabilities that might not be "emulatable",

Well, they'll probably add an MMU on the card (68851). Multitasking? Uh, WHICH home computer has had that since '85? Memory protection? "Please mommie, don't let the bad people steal my memory"... Sheesh, MP is for SISSIES ;)

> like the True Color mode? (I know HAM-8 is capable of more colors, but can
> a desktop or application run on a 14mhz 68020 machine tolerably under an
> emulator to do 65536 colors, even with the nice graphics co-processor?)

Oh yeah. In fact, HAM-8 takes up as much processor time as any 8-bit display. Which means no slowdown if you have fast-mem (basically any expansion memory). I guess the speed of emulation would depend on how the "true"-coloUr mode is implemented.

> I'm going to love seeing how an emulator would handle the DSP and the
> way many sequencers for the ST hit the MIDI hardware.

Good point. They'd probably just add support for the squillions of Amiga MIDI widgets out there. They'd have to... MIDI's probably the only reason ANYBODY would want to use a Falcon *ducks* ;)

> (in fact, if they add the cost of a DSP to the card, it'll probably cost
> as much to get a real Falcon...)

Hm? DSPs aren't that expensive...

[...]

> The A4000/030 is a professional desktop computer. The Falcon 030 as it stands

Neither do 2 of the current Amiga Mac emulators (AMax II+ and Emplant).

>> "I still want a CDROM for my A1200"

>Why? You's still have to get a SCSI controller. Oh, did I mention that that
>too takes up your precious trapdoor. You can only have one.

As far as I have been able to gather the forthcoming CD-ROM driver for
the A1200 (and A600 I think) uses the PCMCIA slot, not the CPU slot.
As for the SCSI interface, several of the 40/50MHz 030 expansion cards
you mention for the A1200 include SCSI interfaces.

>So, if you want everything the falcon has, or can get if you add that MS32
>board, you need to get at least a 32MHz 030, can hold 128 megs RAM, battery
>clock, FPU socket, video capture board (that CyReL can do it with a little
>attachment), SCSI-II controller w/ DMA (not bloody likely), a processor direct
>expansion bus, and SOME DECENT SOUND HARDWARE FOR ONCE! all on one little "trap
>door" card.

If someone wants an expandable Amiga they are hardly likely to choose
the A1200 :-) For a similar price to the 4 Meg Falcon + HD they can get a
A4000/030 + HD running at 25Mhz. This however uses an ec030 without MMU
and does not come with a DSP or SCSI-II but is considerably more
expandable than the A1200. While you may not get a SCSI-II controller
with DMA, the fast and wide SCSI-II controller which is about to be made
available should prove more than adequate. Everything else you mention
has already been available for higher end Amigas or quite some time,
save perhaps the improved sound, though the DSP cards which are coming
ought to solve that problem.

>Hmmm, I think the price of that Mega Board is a bit out of _your_ price range,
>so just give it up. Don't argue Amiga tech with an Amiga tech. You'll loose.

Only if you believe that the A1200 is the be all and end all of the Amiga
line.

Well.... my personal experience with emulators on the Amiga and ST is that
they were a good idea when the ST and Amiga could compete against inferior
low-cost clones and expensive underpowered Macs, but now... excluding the
cost of a good monitor, it's probably more practical to have a seperate
machine and run a network in your home. :)

<the Falcon has built-in Localtalk ports... hehehehehe :) >

*laughs*

Well, the MMU would be good... I know the Amiga has had multitasking since
'85, and it's probably in a much more stable form than the ST or even Macs,
since it was integrated into the system from its inception. I remember how
demo A1000s used to die horrible deaths. Luckily, that means the current
crop don't have to go through the growing pains the Falcon will with MultiTOS.

But what I meant was, as MultiTOS becomes the de facto OS on the Falcon, it
would make the emulator user NEED things like memory protection, etc... that
wouldn't be onboard the A1200 for emulation.

Hmmm. HAM-8 is an 8-bit display with changes made pixel to pixel like original
HAM mode did with 6 bits? Could you clarify how it works so I can
more effectively flame the Amiga 1200?

*just kidding! put the gun down!*

Well, I admit.. if someone is going to buy an A1200 and then emulate a
Falcon, the two things I can think of for even doigp that would be:

1) MIDI
2) direct-to-disk recording (i.e., the programs that will allow one to sequence
and/or record music digitally to hard drive in real time....

> > as much to get a real Falcon...)
>
>Hm? DSPs aren't that expensive...
>
>[...]

That's true... but i'm thinking also in terms of making it accessible to the system.

I've heard C= is planning a DSP for the Amiga... I wonder if it will be able to function as an emulator for the 56001.

>

It really isn't that ugly to my eye. Just different. Personally, the "slan" look of the ST always appealed to me... it was always unique. The A1000 and A500 were ugly ugly ugly. The A500 looked like a C-128 on steroids. In the Atari world, the XE series looked like wimpy STs. :)

<not to flame the loyal 8-bitters, but the XE was ugly... i liked the old 1200 case better...>

## 265. What a concept!

Newsgroup: comp.sys.atari.advocacy

Oh my God! Are my eyes decieving me? or are Atari and Amiga advocates actually....advocating...INTELLIGENTLY!!!! Wow! As the Subj. says, what a concept!

Anyway, since I don't want to post whole loads of messages. (And that subject line is really irrelevant...) I'll just do all sorts of misquotes and undeniable cut and paste maneuvers...

(As much as I like Atari/Amiga, NeXT mahcines are nice. Pokey (esp. for the price), but the OS is great.)

Someone said this in message <76387dafsh834578@I.dont.really.care>:
> Ooh, agonyagonyagony... Where's the Toaster for the Falcon?
>
> -Eyvind

I con't resist this. Read Brodie's CeBit report, esp. in reference to the....

Toaster Roaster!

(Boy, is it getting hot in here?)

Another Message from Eyvind in message <pannsylvania-6-5000@nowhere.u>:

> > (in fact, if they add the cost of a DSP to the card, it'll probably cost
> > as much to get a real Falcon...)
>
> Hm? DSPs aren't that expensive...

News from Commodore: A DSP card for the A4000 line will be released soon. It will cost ~$1200 (US). They use the, I believe, AT&T DSP chip, which buries the 56001. (For that cost, it damn well better!) No talk yet for the A1200.

More from Eyvind in message <GodYouGetAround@everywhere.net.com.edu.mil>:
> No? Well, my bread tends to get kinda old before I finish it off, so a
> toaster is real useful... Oh yeah, I was talking about the VIDEO toaster.
> Well, before I respond to THAT, could somebody tell me what a Cubase Audio
> is? (Yeah, I've figured out it has something to do with sound :P)
>
> -Eyvind

Cubase Audio? Do you know what Cubase is? Well, Cubase Audio allows you to mix p to eight channels of 16 bit stereo sound with MIDI, tapes, live music, et al. It's out for the PC, Mac, and Falcon. All computer require the Yamaha Whachamajig to allow that speed of analog to digital conversion. This piece of equipment costs about as much as a small sports car (Okay, Sedan [a.k.a. ~$4000]) The catch is there is another version that only the Falcon can handle that doesn't require your next three months mortgage payments. The catch is

you can only record four channels to the hard disk, SCSI-II isn't fast enough (!!!!!!!!!), but you can record the other four into RAM, or play them from RAM onto the Hard disk after you've recorded. Not quite as fancy, but still DAT quality.

Call Steinburg for more info if you want it, or American Music.

From Raw Shark in message <a couple back@here>:
I _really_ don't want to add > to all those lines, so I'll paraphrase and just say that he said the price of a 4000/030 approaches that of a Falcon030.

Let me say, kinda.

Yes, you can buy a 4000/030 (from me, of course) for $1,899.95. w/ 4 megs RAM and 120 meg HD. That is considerably better HD and expansion than a Falcon (PLEASE! notice the qualifiers...) However, the MSRP is $2,399. Wait, you say, that's over $500 savings. Yup. The MSRP for the F030/4/65 is $1,399.95. I can probably find one for $999.

Kay?

Well, I hope this answered some questions, and I hope even more that more people will advocate with intelligence, not lies.

To set the record straight, I know a whole bunch of how the Amiga works, I have to since I have to sell and service them. If I could get an A4000 for the same price as I can get a Falcon, I may just buy one. However, I've had an ST forever (i.e. my first "real" computer,) and I really like it. I want the F030 also to run the oodles of Apps I have for my ST. Besides, it's almost as cheap to get this as it is to upgrade my system with just the RAM and Hard Drive this has.

Well, I do have school work to do, so I'll reply to everything you say later.

## 266. Toaster Shmoaster

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-14 18:44:32 UTC

Source record: 23002

Do you want to know where the Toaster is for the Falcon? How about
the CyRel Cyber Cube. Not only does it run on the Falcon but it runs
on the TT! This little device not only does what a Toaster can do but
it does more and it does it FAST! Not to mention the fact that we have
the software to support it, like the PHASE-4 line which has expanded
so an ATARI with a CyRel in it equals if not surpasses an Amiga with
a Toaster.

Acutally, I don't even know why people bother with things like the Toaster
anyway (or similar devices on other platforms ;-) because I've been
to advertising agencies and other places where professional video is
produced and I have yet to see an Amiga with a Toaster or that Toaster
stand alone thing. What I HAVE seen is Quantel Video paint boxes and
Macintosh Quadras outfitted with Torx boards.

The only use I can see for things like the Toaster is for At-Home-Ed doing
his video titling or the nerds in High School AV rooms (Which is the ONLY
place I have ever seen an Amiga with Toaster or no!)

Just a little Advocacy but then again, at least I know where to post a
message like this unlike SOME Amiga people (not all, SOME).

Have a nice day :-P

>all the programs that ran on their stock machine work with this new board
>provided they go through the OS services?

Well, yes and no. :-) Until 4.0 (3.1?) AmigaDOS wont have complete RTG
capability, so in a sense, it's not supported. But most of the newer
graphics cards (Retina, Picasso..or whatever they call them now) come
with replacement graphics.libraries. ie. They actually replace the
whole grphics system with one that supports their card as well as the
standard amiga video modes. Sorta like a driver, but not really. Every
program that uses the OS for graphics will work on these cards, esp.
programs that can run on the Workbench. Its somewhat of a hack, but it
works.

## 268. (ADVOCACY) Life, Liberty, and the Pursuit of Silliness...

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-14 19:41:18 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1331@usdtsg.DaytonOH.NCR.COM>
Source record: 23007
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Sorry to respond in comp.sys.atari.st (the advocacy group isn't at
my site yet). Anyways, a rare respose of mine to a flame - hit that
'n' key now to avoid it :-)

In article <huots00.737362021@tohi> huots00@tohi (SYLVAIN HUOT) writes:

>YARK!! Atari world is so closed that nobody needs to exchange with
>other platforms ??

Yark???

I dunno, I exchange graphics, sound, word processing files, etc
between my MSTE and 386 (and MAC)...

>When i am doing FTP, i ALWAYS copy files directly form the Sun's floppy to
>a MS-DOS Disk, and i read them directly with my Amiga ...

Funny, that's exactly what I do with *my* Atari. Who knew? :-)

>I think that all people that needs to do many normal things with their computer
>*AVOID* to buy a ATARI ST/STE/TT/FALCONVAPORHARDWARE 'cause they know that
>computers can't ...

Doesn't sound like you've ever *used* an Atari, muchless know what it
can/cannot do. *All* stock ST's can read and write IBM format disks with
no problem (720k). Newer machines (Falcon, TT, and my MSTE) can read and
write 1.44meg IBM disks as well (my MSTE is stock, BTW).

re: "to do many normal things with their computer" - I shan't ask what the
alternative is... :-)

>... other that buy ATARI don't care what others do, they don't know frequently
>what AMIGA/MAC/PC do !!!

I have a PC (286) as well as a MAC emulator, and a friend of mine has
an Amiga - have seen what they can do...

>And, in opposition to ATARI computers, all these colors on AMIGA have
>professionnal applications and using. I think you know well DESKTOP VIDEO
>and MULTIMEDIA.

I never knew there were "professional" colors and "amateur(?)" colors.
How do you tell the difference?

>When you try an Amiga ... you didn't want to exchange it with a PC, a MAC
>or a ST! ;-)

I've tried Amigas. I wasn't overly impressed (nor disappointed)...

>Falcon is technology of tomorrow for after-tomorrow ... with promises to
>be relaesed yesterday!!!

...why do I have the sudden urge to watch an Abbott and Costello
routine :-)

>The important thing is to be satisfied with youe computer, same as you said!

Yep, Amiga, Atari, or whatever. Doesn't matter if someone else doesn't
like it ;-)

>But, try seriously an Amiga 1200, and i sincerely think that you will never
>want your ATARI again.

One of my friends has a A2000. I've stayed with the Atari however...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...to those non-Atarians: I don't intend this as a flame (I've said
nothing bad about non-Atari systems above, as you can read) - I just felt
the message being replied to was misinformed enough to point a couple
things out (including a rather one-sided view of the world of computers) -
the sarcasm is in response to that, and not to the computers being talked
about... (so don't yell at me Raist :-)

I bet you had a Maxtor drive. I ran into the same problem. C= has not sanctioned the use of the Maxtor drives in the A1200, but I had my local dealer put one in because they are so inexpensive. What I found out later was that the A1200 was overrunning the Maxtor, and this was fixed by setting the maxtransfer rate of the drive setup down a bit (easy to do and not much of a performance hit, but a real BEAR until I figured out what needed to be changed).

This brings up four points they I feel are very important. 1) Make sure your dealer knows what the HECK he's doing before he adds hardware to your system (Amiga, Atari, Mac, or whatever); 2) Commodore did not sell a "defective" computer to me, I managed to make it defective on my own ;-) ; 3) I wish Commodore would sell the hard drives that come with the A1200 for a reasonable cost so that we mere mortals would not be as tempted to buy third party parts. I, for one, am not a hard drive expert; 4) This is
NOT a good example for condemning the A1200, or any computer for that matter. It is,

however, unfortunate that this situation caused frustration for you.

Sorry about jumping into this in an Atari forum, but I didn't want everyone thinking that A1200's with hard drives are unstable. Just me ;-)

Marcus :-)

What you have seen, my friend, is $$$EX$PEN$IVE$$$ high-end stuff. Sure, T2 wasn't done on an Amiga/Toaster, it was done on a Silicon Graphics workstation. I have a hypothetical question for you. If you were a small cable company, say, wanting some special FX and a text generator, would you want to pay $LOT$ for a RealityEngine-equipped multiprocessing computer, or would you want to get something cheaper, but perfect for your needs. Would you pick (a) a Mac, because you have no braincells; (b) an Atari, because - what the heck - if you haven't HEARD of them doesn't mean they're bnot *GOOD*, right?; or (c) an Amiga with a Toaster, because most small cable companies USE Amigas w/ Toasters. Gee, these tough calls, huh?

> The only use I can see for things like the Toaster is for At-Home-Ed doing

Really. Guess you haven't been looking to close now, have you? Oh, I've seen ONE Falcon. Seemed OK, I guess (nothing mindblowing, but then again it was NEW); what happened? It had to go back for repairs. To Holland. And still hasn't come back (although I understand this isn't Ataris fault...)

> Just a little Advocacy but then again, at least I know where to post a

Your obviously ignorant about the Toaster and the Amiga. Nothing comes close to
a Toaster. What is this Cyrel Cyber? Is it vapor like the Falccon....I would
check out the Video Toaster Magazine which has a circulation of over 60,000
each month, alot more than any Atari rag put together. I have seen Atari rags,
very unprofessional compared to the Amiga ones..

Just a quick note on the Emplant emulator for the Amiga. Someone said that it would be emulating a Falcon soon - I don't think so!

I read a quote in this months Amiga shopper( I think that was the mag) by the vice-president of the company that makes the Emplant. He said that Falcon emulation was 'a long way down the road'.

Ok, what video modes are more "useable"? The Falcon handles resolutions up
to 640x400 with 65536 colors at once. The video modes on the VIDEL chip
appear to be completely programmable (a program called SUPER78 sets the chip
for a higher resolution and refresh rate in *software* to 800x600 with 78hz
refresh).

As for 8-bit audio..that is my point, it is *8*-bit. The Paula chip was
nice when the Amiga first came out, but if you look at a Falcon, it has:

1) the dinky (yes, it does suck) original ST/Yamaha 3-voice monstrosity.
2) the STe-model DMA sound chip which "doesn't need to be babysat".
3) the DSP which can push a Codec around for 16-bit digital audio output

For sound playback, which would you pick?

Also, consider this... the NeXT ran a 56001 in a multitasking environment.
I've used one casually, and I found it to have no problems with it being
a "single-program commodity". In fact, to satiate my curiosity, what
happens on an Amiga if two programs both want the sound chip and it is
out of voices? Does it dynamically allocate the voices or deny requests
while it is still in use?

>
>We've got the software; we've got the hardware. Theoretically, the

I would say the Amiga *video* software is there. I don't know about the
music side. 8 bit audio should be adequate for some people, admittedly,
but it isn't going to be that way for very long with 16-bit sound cards
becoming commonplace in PCs.

>For Multimedia purposes, the LAST machine one would likely consider would
>be a Falcon.
>

Consider this as well: Do you really think that the word multimedia comes
to the mind of a newbie along with the image of an A1200?

(probably not... the world is revolving around PCs)

Now, I could bash the Amiga, but that's not the solution. Here's what
I think they could do to compete against the PC and Mac...

The Amiga has excellent video capability. I think they beat Atari to the
punch with video in the A1000/500/2000 machines, and they definitely crushed
everythin below SVGA for quite some time. However, since then I have not
seen them market a machine (excluding the 1200/400 line) that could hang
with the PCs or Macs for the price.

Given the new aggressive pricing by Apple on the Centris, LC3, and Performas
for newbies to eat up for multimedia and home use... much less the clones
with multimedia sound & graphics, I don't see the Amiga competing unless
they market the 1200 and make it more widely known that they have a
multimedia capable machine. Upgrading the sound would be a BIG plus...
The graphics are good enough for now.

Question: How much does it cost, and what systems does it run on in the
Amiga line?

(it's not much good if it costs $1500 or more.. and can't run on an A1200)

: refresh).

Of concern here is both support for interlace and for variable size--the
Amiga's video modes are TOTALLY programmable. If your application suits
it, you could create a screen of 320x96; or any other size. Up through
800x600 and beyond. Not just 320x200; not just a couple of set standard
modes; ANYTHING.

A literal multitude of resolutions exist for common usage, with more on
the way through AGA.

: 1) the dinky (yes, it does suck) original ST/Yamaha 3-voice monstrosity.
: 2) the STe-model DMA sound chip which "doesn't need to be babysat".
: 3) the DSP which can push a Codec around for 16-bit digital audio output

: For sound playback, which would you pick?

If I need the CPU to be doing other tasks, then 2. Fact of the matter
is, you've got ONE thing that you can use that DSP for; it's a
single-task chip. Fact of the matter is, if you're pushing your
presentation system, then you don't want to be messing with it for audio,
when you might need it for better things.

: Also, consider this... the NeXT ran a 56001 in a multitasking environment.

The NeXT did NOT multitask the 56001, however.

: I've used one casually, and I found it to have no problems with it being
: a "single-program commodity". In fact, to satiate my curiosity, what
: happens on an Amiga if two programs both want the sound chip and it is
: out of voices? Does it dynamically allocate the voices or deny requests
: while it is still in use?

There are four voices; if it doesn't have any, it fails.

With, say, a 3210, not only would your OS multitask, your DSP's OS would
handle the DSP. The 3210 has full DMA capability as a part of it, and a
multitasking OS to boot. So, even if it WERE a single-task chip, the
fact that there isn't any overhead in its operation (because it can do
whatever it needs to on its own, with its own program if necessary) means
it can be that much more useful in presentation systems that push the

limits of the hardware.

With the Amiga's Paula, it is very similar--there's next to zero cpu usage, even on slow 8mhz 68000's, because of the design. The only thing having audio costs you, in fact, is a bit of code, and space. That's why mod players are a dime a dozen on the Amiga; that's why there are so many of them.

: I would say the Amiga *video* software is there. I don't know about the

Definitely; and with multimedia, one won't deny that video is a big part.

: music side. 8 bit audio should be adequate for some people, admittedly,
: but it isn't going to be that way for very long with 16-bit sound cards
: becoming commonplace in PCs.

And with the Amiga, that 8-bit audio isn't the only solution; it is, however, present on every system, and is very cheap to run, resource-wise. One cannot say that of many PC audio systems; one cannot say that for many systems.

: Consider this as well: Do you really think that the word multimedia comes
: to the mind of a newbie along with the image of an A1200?
: (probably not... the world is revolving around PCs)

So because the world revolves around the PC, it is a resolute decision to choose a Falcon over a 1200 for presentation purposes? That doesn't even have a SEMBLANCE of reality in it; it's a totally separate argument.

The Amiga is making rather decent headway into the realm of multimedia, both in kiosks and in widespread usage. With some agressive marketing from NewTek and C='s continued and hopefully stronger advertising in the multimedia and video markets, that will get better, not worse.

One wonders whether that can be said for Atari, or the Falcon.

Greg

You make it sound like if a Falcon is pumping out 16-bit audio it can't do
anything else... the factof the matter is, if you look at the applications
being designed for the Falcon, they assume the DSP is independent and
capable enough to leave enough time for the CPU and the rest of the system
to get a LOT of work done.

And for a presentation, it usually involves playing back video, which is
more CPU intensive and not usually something a DSP would be involved in
unless you want to get fancy and use the DSP for some of the fixed point
math you might want to try...

I was about to bash that paragraph as being irrelevant because the 3210 DSP
for the Ami isn't available (that i know of) anywhere. In fact, at this
time, I haven't heard any official word on it, but I have heard tons of
rumors.

Granted, more sophisticated DSP's exist, but just like the touted
Paula chip that is "standard" on Amigas, consider this... every Falcon
sold will have a DSP. This means that as the Atari computer line goes into
the 90's, everything from the base F030 model in the 1040-style case on up
will be capable of 8 channels of 16-bit CD quality audio output.

>
>With the Amiga's Paula, it is very similar--there's next to zero cpu

.MOD players are nice, but they are hardly unique to the Amiga... the STe/TT
have them, and so do the PC and NeXT that I know of.

Also, remember this: the PC clone market has got more soundcards sold than
there are Amigas out there. A lot of those cards have 16 voice and 32 voice
polyphony. The Amiga is still doing 4 voices of 8 bit audio.

>: I would say the Amiga *video* software is there. I don't know about the

I agree, the Amiga video software has been consistently ahead of the rest,
and to the Amiga's favor... a lot of the software from their developers
is AFFORDABLE. PC and Mac owners can drool. Atari has only 1 really good

package I see that runs across all models, and those are by Lexicor, but they appear to be professional quality goods...

>

Resource-wise, I don't think it's a big problem for a PC owner to run audio if they have a fast enough system. Granted the sound cards I've seen run off the bus, which is slow, but they are usually capable in and of themselves of doing such tasks as sample playback without straining the machine.

Also, like I said... there are millions of PC soundcards out there.

(come to think of it, if we drag the Mac in to this, consider that they have has 4 voice monophonic 8-bit sound in all their machines since before our machines were shipping)

You missed my point. :)

*whoosh*

You're spending a lot of effort to say how much better the 1200 is over the Falcon as a multimedia machine, and the purpose of that statement I made was to ground you back to reality... as much as you may despise Atari, and love your Amiga, you have to always remember that this is a DOS/Windows-based world and that they have a market size that dwarfs our own. When you argue that the Amiga 1200 is some incredible multimedia machine, remember that it will be compared against 486/33 machines with SoundBlaster Pro cards and video boards that have graphics modes equal to AGA. Sure, some aspects of their performance may not match our machines, but they are the de facto standard we have to match.

This is an incredibly optimistic viewpoint. :)

What is Commodore's market share of the US computer market? How many machins
have been sold total in its time?

(i'm sure it's at least 2-5 times bigger than the Atari ST market :) )

Now remember, the world is full of PCs and Macs. Has C= reported any
$2 billion profits in a quarter lately?

>One wonders whether that can be said for Atari, or the Falcon.
>

I would say... for the niche uses I have for it... and for the music
market (my use), the Falcon will probably become THE platform of
choice.

You are using 800*600 with AA chipset? Gosh! A friend of mine has an Amiga
4000 and doesn't consider any interlaced mode suitable for doing something
with the machine. In his opinion these modes are just good for viewing
pictures using ViewTek. Remember, the Falcon will do 1152*832 in 87Hz
interlaced with the ScreenBlaster, an external hardware that is available
for ~100 $, bundled with NVDI here in Germany for ~ 150 $ and bundled with
a Falcon (at an Atari dealer in Hamburg) for ~ 65 cents. Not to mention
that it gives you resolutions like 880*608 at 60Hz noninterlaced (the fewer
pixels you have, the higher is the refresh rate).

>A literal multitude of resolutions exist for common usage, with more on
>the way through AGA.

Yeah, like 1440*256 or 800*300 noninterlaced (add some percents for overscan
if you feel like it). Interlaced modes might be great for viewing pics or
similar, but they are virtually useless for any other purpose.

>3) the DSP which can push a Codec around for 16-bit digital audio output

I've got to set things right: the 16-Bit-Sound can be used without the DSP via DMA. The DSP is only a Signal-Prozessor to transform digital data (so you can manage such nice effects like Harmonizer, Pitch-Bend, Equalizer, Echo, Flanger etc...). The sound itself is produced by the DAC in the Falcon and can be connected to DMA with the integrated CODEC-Chip. You can play Digi-Sound with 49 Khz without any loss of CPU-perfomance!

I have to admit, that its difficult for the Falcon to produce Digi-Sound in any frequency because the Falcon has only 11 fixed frequencies.

Ciao, Heiko.

YOU DON'T UNDERSTAND. The *DSP* *ITSELF* is running a multitasking OS.
We don't care whether the computer is multitasking. Any computer can
do that nowadays. The AT&T 3210 and Motorola 9600x can do this. The
56001 can't. It couldn't in the NeXT. It can't in the Falcon.

[BTW, why did C= not use the 9600x instead of the 3210?]

In most cases, yes.

> Granted, more sophisticated DSP's exist, but just like the touted

Falcons are few and far between. You're comparing the measly
procession of Falcon's vs. the full line of Amigas. This is like
comparing the A4000 vs. the whole Atari ST-descent line. The fact of
the matter is, the AVERAGE Amiga comes with BETTER graphics and BETTER
sounds than the average Atari, and I would venture to guess that there
are more A4000's out there than Falcon 030's, in any case.

> .MOD players are nice, but they are hardly unique to the Amiga... the STe/TT

I don't think it was 4-voice in the original lineup.

My experience was similar when the only PC soundcards that I'd heard were the SoundBlaster and SBPro. However, I now have a PAS 16 and my friend has a GUS which both play mods as well as any Amiga. There are several different mod players for DOS and Windows, and I wouldn't be surprised to see them appearing for OS/2, NT, Linux, BSD, and others if they haven't already. Believe it or not, there is a mod player which loads mods into high memory and lets you shell out to DOS. The performance hit is minimal and there are surprisingly few problems when running DOS apps. Under Windows, even with it's inferior brand of multitasking, it is no problem to listen to a mod while watching a video, compiling, using the network, and doing other things which were once thought to be the private domain of the Amiga.

No doubt about that, but the shear numbers of customers in the Clone market assures that the prices will be lower. It's not something which makes me or anyone else who likes the Amiga happy, but it is the unfortunate reality.

If I remember correctly, even the original Mac had 4 voices, but it was due to software, not hardware. From the Mac II on, most of the Macs had some sort of hardware assist, but audio has certainly never

been their strongpoint. Amazingly enough, even some of their newer
machines were (are?) still saddled with the more primitive audio.

>>
>> The Falcon's VIDEL can do this too.
>
>Yeah, but through the OS?

That's ambiguous. There may not be OS calls that directly set the resolution
to any arbitrary x and y coordinate size, but once the video chip is set to
a given mode, the OS will recognize it and the VDI will handle it. This is
the sort of resolution independence via OS services that is most important.

Basically, the approach on the Falcon for this seems to be to write a small
driver that goes in the /AUTO folder and then once the video mode is set,
including refresh rates, the AES/VDI can handle it.

That's a good point. But I already knew the 56001 wasn't multitasking in
and of itself. However, it's important to remember that like any other
device, the DSP's non-multitasking nature doesn't necessarily make it
unusable.

(think of it like a printer port, for example..if one application grabs it,
another shouldn't be able to write to it... this limits the power of the DSP
for multitasking environments so that only one app gets it, but consider this:
no other computer selling right now even HAS a DSP standard for under $1000)

It doesn't matter what the average Amiga does against the average Atari
any more. What matters is what the current generation of machines do.

The A500/2000 clearly had better graphics and sound that the 520/1040/Mega ST.
The STe closed the gap, but I personally think the features were never
exploited enough to make it a true "Amiga killer". The TT030 was the
best machine, but also the most expensive, but I feel it could compete.

The Falcon030 represents a whole new generation of machine, though.

The fact that the A1200/A4000 have shipped more units (as of today :) ),
is not the issue when we're discussing hardware capability. If selling
lots of units meant your hardware metamorphosized into the ultimate
computer, everyone would buy a clone and we wouldn't be having this
discussion, would we? :)

)

Ok, I'll call your "bluff"...

Name them and give me suggested retail price and street price, and give me specs. And tell me how many program use them because... gosh darn it... doesn't everything use the wonderful, standard, Paula chip? :)

(sound is not like video on he ST or Amiga where your OS can accomodate new video capability in software... you can't call an OS function and say "play me some stereo samples of strings playing a C4 major triad")

>

I vageuly remember the Mac having 4 voice mono, but am not sure of the exact models. I do know the Mac II had 4 voice stereo sound from the beginning. That would have been around 1987... pre-A3000 and pre-TT.

Hmmm. I know the Falcon (and I think STe) do set the sample playback rates
to fixed speeds. I had hear it was possible to send in an external clock
to the DSP for sample playback to get rates that aren't already supported.

(although this may not be important for sample playback, since I think most
playback rates from the DMA engine are conveniently provided for)

A true life story:

A friend of mine wanted to upgrade his A500. The only problem is that he
wants to use his computer for composing music. Hearing that the A1200 has
only the 4 8-bit channels of his A500, he was very disappointed. Amiga
sound expanders are either very expensive or of low quality. The only
advice I could give him was to try and get a hold on a Falcon. Atari had
a major role in music with the ST, so a Falcon is just continuing the
tradition, and is best if you want music. It might not have the greatest
graphics build in, and the OS is probably not as good (I don't really
know the details, but 8.3 file names are really not for me).
So it's really a matter of what you want to do with the machine. Personally,
I won't move to either an A1200 or a Falcon. I'm waiting for AAA...

Define OS? A little program that you put in your OS folder could. You could even get a .CPX (not that you'd know how that works) with it, so yes. In fact, the only remote way the Amiga OS changes the screen mode is by a little program in your System/Preferences drawer. The _only_ thing that ties that to the actual OS, is that they come bundled together....

Please read the paragraph you followup next time. He stated that "as the Atari computer line goes into the 90's, everything from the base F030 model in the 1040-style case on up will be capable of 8 channels of 16-bit CD quality audio output." Please note the "into the 90's" and "from the base F030 model...up." See? From the F030.

Whoa. I don't think so. Try one on a 486 DX/2 66 w/ Viva Maestro 16-bit stereo sound card running at 44kHz. I _buries_ the Amiga .MOD players. [P.S., sound familiar? 16-bit, stereo, 44+kHz..... ]

But not as cheaply. Give me some products, and I'll get you prices on them, including the equivilant PC product. One warning, you must be able to beat $199 for 16 bit, stereo, 44kHz sound. Not as solid as a Falcon, but still available.

Please, in the future, distinguish between "can" and "ships with".
There is a multitasking kernel for the 56001, and I think Mr. Elst wrote
one too, though I'm not positive about that.

>[BTW, why did C= not use the 9600x instead of the 3210?]

Price and programming environment would be my guess....

>Sure, if you want to discuss addons, we can get that many channels too.

Geez, buy yourself a "real" synth and hook it up through MIDI....

>>>Does this mean the Amiga should be used for direct-to-disk sound recording?
>Question: How much does it cost, and what systems does it run on in the

It costs you nothing but a piece of software and the appropriate (any)
sampling equipment. Really, I have some truly HUGE (tens of megabytes)
of samples recorded via a parallel port sampler (home made, even, running
off a nine volt battery :) ) and put on disk.

Not sure if he had a scope display up at the same time either, but that's
neither here nor there.

>(it's not much good if it costs $1500 or more.. and can't run on an A1200)

Hmm, we sold the software for $150 to a guy in Holland just recently, and
you can probably make a sampler for $30. Please note, the program is for
acq. and analysis, not just direct-to-disk recording....
I'm just trying to point out the fact that the AMiga is fully capable of
it.

>out of voices? Does it dynamically allocate the voices or deny requests
>while it is still in use?

Audio requests and ownership are done on a "priority" basis. So, for example,
if your MOD player was playing a tune at pri. 20, and a 100pri. warning
beep was issued, the OS would send a packet to the MOD player, the MOD
player would release the hardware, the beep would go through, and the MOD
player would reacquire the hardware afterwards.

>I would say the Amiga *video* software is there. I don't know about the
>music side. 8 bit audio should be adequate for some people, admittedly,

I agree with you that our music software sucks. And it's also true that
we only have 8bit DMA'd audio -- however there is a 6bit volume which
makes the full range more like 12bits....

>but it isn't going to be that way for very long with 16-bit sound cards
>becoming commonplace in PCs.

Many of these "16"-bit audio cards only deliver 14bits or less out of
the jack. Very few go through the pretty steep requirements of digital-->
analog conversion at that resolution.

I agree with you, btw, I just want to make sure we're really talking
about the same thing, and not speaking marketese....

>Consider this as well: Do you really think that the word multimedia comes
>to the mind of a newbie along with the image of an A1200?

No, A4000 maybe. Unless you're talking about embedded systems....

>(probably not... the world is revolving around PCs)

Not. Maybe the computer-business world is :)

>resolution : 640x480.

You can do MacX on a lowly Mac SE w/4meg of RAM (I've done it %-)) on an Appletalk network. Not a big deal. Granted, trying to use one of those dinky screens means you ahve to use a VERY small font and Appletalk can handle a max of 1/10th of ordinary ethernet but it is possible.

And since a Falcon's network port uses the same hardware a Mac would use for Appletalk....

[Has anyone looked at the CAP (Columbia Appletalk Package - software for Unix machine so they can talk to Macs on Appltalk etc) software to see if it'll run on an Atari ?]

>
>Not sure if he had a scope display up at the same time either, but that's
>neither here nor there.

If I remember correctly, I used an A3000 running the Web with the parallel port stereo sampler data source running at 80us interrupts with 3500 samples per waveform, a tiny waveform display window, and was replaying the stereo through three audio channels (audio 1 playing channel 1, audio 2&3 playing channel 2), and the Filesave module which was writing to a Quantum EPS170 drive (which isn't particulary fast). Was replaying the digitized sound to confirm continuous recording. (The audio playback is almost no overhead.)

The A4000 can display waveforms terrifically faster than the A3000, but that blasted IDE drive incurs a lot more overhead, so I get about the same disk write performance, but I can be running more realtime filters like Delay, windowing, gating, and the FIR filter.

When you get rid of the high interrupt processing rate required to service the parallel port digitizer, things run a lot faster. When I have those two DSP Tech transient recorders hooked up (one is broken and was sent back home), I can record direct to disk, four 8k, 8 bit waveform events at over 200k/s to the stock 120MB Maxtor that came in the A3000 with a large waveform display and several filter modules running. Also, the tr's transfer rate is the limiting factor here.

This is using the camac bus converter where the Amiga reads the tr's memory directly via a ZorroII<>camac branch highway/A2 controller. I would be using branch demand interrupts from the camac, but the tr's lam interrupting capabilities are broken and DSP Technologies apparently doesn't know how to fix it. (You guessed right, I wouldn't recommend anyong purchasing DSP Tech equipment. Support is flat lousy.)

Also, one should investigate the Sunrize board for 8 channel direct-to-disk at 16 bit if I remember correctly.

: So it's really a matter of what you want to do with the machine. Personally,
: I won't move to either an A1200 or a Falcon. I'm waiting for AAA...

There is a major difference between the A1200 and the A500 era machines. Chip RAM. On the 500, friends of mine were always using low sampling rates so they could get enough different sounds into their music. They all had 512k chip. The 1200 lets you have 2meg of of chip ram. The sound quality can get a lot better if you're going to up the sample rate by a factor of 3 or 4. I'd imagine that the results of an OctaMED type of program would be that much better too.

Of course, you could alway buy the 2meg hack for the 500, or buy a 600 if 2meg is what you're looking for. Or you could wait for a better sound chip.

>when you might need it for better things.

You seem to be implying that the Falcon can't do sound at the same time as
it does anything else. This is absolutely incorrect. Let's just point out
some facts about the Falcon that seem to have been overlooked :

1) The DSP has _nothing_ to do with recording and playback of digitized
sound, except for adding special effects which are entirtely
optional and a separate issue.
2) The Falcon can record stereo (2-channel) 16-bit audio directly to the
hard drive at 50 KHz without even touching the DSP chip. This is a
direct result of the cleverly designed DMA sound subsystem and the
very flexible nature of the whole system. The Falcon allows
patching to/from the DSP, DMA hardware (which is what gets involved
when saving to hard disk), ADC (audio input), and DAC (audio output).
3) There is really no overhead at all incurred when doing playback of
digitized sound at any frequency, again due to the DMA subsystem
which doesn't need any CPU time once the playback has been started.

So, to sum up, you could start a stero 50KHz (AND 16-bit) 20-minute song
playing from the hard drive and then let the CPU go do something else with
very little slowdown. I think this just about covers any of your complaints
about the Falcon's audio capabilities.

I don't think you could really argue that any Amiga has better built-in sound
than the Falcon does, nor does any other computer on the market at this
point. It seems to be the case that the Amiga is best suited for video
applications and the Falcon is suited for audio applications, which makes
sense if you think about it -- each company is trying to capitalize on their
biggest niche market right now, although either system is pretty good
overall.

In article <1tcgc3$79d@cville-srv.wam.umd.edu>, FLiP (cmedley@wam.umd.edu) wrote:
: The Falcon's VIDEL can do this too.

Last I heard, you could reprogram it to accept new pixel clocks; that isn't the same.

And the number of resolutions one can reach as a default on the Falcon is SIGNIFICANTLY less than the number of resolutions on the default AGA system. And since we're talking about multimedia, it's likely that you'll be using default capabilities, not ones you hand-code.

So, unless I'm wrong about the VIDEL on the Falcon, the Amiga still has the upper hand in both areas.

: You make it sound like if a Falcon is pumping out 16-bit audio it can't do
: anything else... the factof the matter is, if you look at the applications

NO. Definitely not. But I certainly wouldn't say it's anything like a "free operation", which it certainly isn't, unlike the Amiga.

: being designed for the Falcon, they assume the DSP is independent and
: capable enough to leave enough time for the CPU and the rest of the system
: to get a LOT of work done.

And, like I said, we're talking about a system that would push the limits of what is possible for the hardware--a 1200 and a Falcon, both being pushed; that's the comparison.

: And for a presentation, it usually involves playing back video, which is
: more CPU intensive and not usually something a DSP would be involved in
: unless you want to get fancy and use the DSP for some of the fixed point
: math you might want to try...

Yes, you might want to use the DSP to help you with video. Then again, you've got to either give up audio, or go back to STe, which isn't nearly as nice as the Amiga audio system. And the Amiga would still have the upper hand, because it's got full 32-bit pathways to all memory as well, and on top of that, you've got the ability to run out of fast ram, an ability that doesn't exist on the Falcon without a little trickery...

: Is 4 voices of 8 bit sound enough for multimedia?

Some would say yes. If you're doing a direct-from-disk audio playback, certainly--two voices, one left, one right, is enough to get you full stereo. If you're doing modules, the mod players prove that it's perfectly possible.

And then there's the important capability to mix in audio from other sources through the system. That's where the programs themselves come in, and AmigaVision, as a good example, allows you to make use of an attached CDTV player to play audio, or to play animations in CDXL from.

: I was about to bash that paragraph as being irrelevant because the 3210 DSP
: for the Ami isn't available (that i know of) anywhere. In fact, at this

You'd be right to; it's not.

: time, I haven't heard any official word on it, but I have heard tons of
: rumors.

It's been mentioned by C= as being a product that is on its way, just as the MPEG card is. Nothing more. But it is due soon. It awaits 3.1.

: Granted, more sophisticated DSP's exist, but just like the touted
: Paula chip that is "standard" on Amigas, consider this... every Falcon
: sold will have a DSP. This means that as the Atari computer line goes into
: the 90's, everything from the base F030 model in the 1040-style case on up
: will be capable of 8 channels of 16-bit CD quality audio output.

Correct. For that, we must wait for the two up-and-coming chipsets. As a default, the Falcon has a much more capable audio system. However, the cost of using that audio system is not always warranted, and the closer you get to your system's limitations, the more likely it is that you'll drop away from it.

: .MOD players are nice, but they are hardly unique to the Amiga... the STe/TT
: have them, and so do the PC and NeXT that I know of.

The majority of them are there to play mods created on the Amiga. The mods/trackers more or less originated here, and they continue here. Many can play them, yes; few can do them with the miniscule amount of overhead it takes on the Amiga. And THAT is important.

: Also, remember this: the PC clone market has got more soundcards sold than
: there are Amigas out there. A lot of those cards have 16 voice and 32 voice
: polyphony. The Amiga is still doing 4 voices of 8 bit audio.

A lot of those are SoundBlasters, rather incapable pieces of junk in comparison. That 4 voice 8-bit audio is capable of rather nice sampling rates which aren't hardwired like many of those cards, they can be combined, they have individual-channel volume control (64 levels), and they can accomplish more than the majority of those cards because of the features that went into its creation.

Even now, there are few audio systems as nice as that of the Amiga.

: Resource-wise, I don't think it's a big problem for a PC owner to run audio
: if they have a fast enough system. Granted the sound cards I've seen run off

Again, the solution is to throw more hardware at the problem, rather than getting it right the first time. The fact that the Amiga's audio costs next to nothing to use is an important factor, especially when you're

talking about multimedia--the last thing anyone would want to do is make the base kiosk require a Pentium and a MondoVideo SuperVGA Hyperaccellerator. The cheaper, the better, and that gives you a big plus in the Amiga's favor.

: the bus, which is slow, but they are usually capable in and of themselves
: of doing such tasks as sample playback without straining the machine.

Add the rest of the multimedia tasks, and you won't be quite as happy. Again, with multimedia, the audio ALONE isn't the issue--it's the audio on top of everything else. Many can tell you how bad many of the PC-based multimedia systems are on the PC.

: Also, like I said... there are millions of PC soundcards out there.

Millions of SB's. Doesn't say or mean much.

: (come to think of it, if we drag the Mac in to this, consider that they
: have has 4 voice monophonic 8-bit sound in all their machines since before
: our machines were shipping)

And again, cost is a factor... not price, but resources. Of course, one could argue that Mac users are used to their systems being unusually slow.

: You missed my point. :)

Yup.

: You're spending a lot of effort to say how much better the 1200 is over
: the Falcon as a multimedia machine, and the purpose of that statement
: I made was to ground you back to reality... as much as you may despise
: Atari, and love your Amiga, you have to always remember that this is

I do NOT despise Atari; I just think that the Falcon is a weak contender from a company I once bought several machines from. I left the ST's for the Amiga for a good reason, and I've never regretted that. The Falcon was 100x better when it was nothing more than vapor. After the "wonderful" machine was introduced, little architectural flaws began to come out; so many, that the machine is crippled by its design.

: own. When you argue that the Amiga 1200 is some incredible multimedia
: machine, remember that it will be compared against 486/33 machines with
: SoundBlaster Pro cards and video boards that have graphics modes equal
: to AGA. Sure, some aspects of their performance may not match our machines,
: but they are the de facto standard we have to match.

If that's what the 1200 is being compared against, it'll win in most cases--do remember that if we're talking about kiosks, then cost is a factor--and that Amiga system will give you a much bigger bang for your buck when it comes to multimedia operations.

: What is Commodore's market share of the US computer market? How many machins
: have been sold total in its time?

Oh, 4-5 million machines; but it isn't the US numbers. Very small in the US, very big in Europe.

: Now remember, the world is full of PCs and Macs. Has C= reported any
: $2 billion profits in a quarter lately?

We all wish. But no.

: market (my use), the Falcon will probably become THE platform of
: choice.

Agreed.

There are the Sunrize boards. (A1012 and A516, I believe, are the model numbers...) In addition, there's the new $200 16 bit digitizer/player unit. I'm not sure what the price on the Sunrize boards are.

The Mac II had far superior sound compared to previous Macs. I know that much.

Hey, Eyvind, bad day?
I was referring to professional scoring (you know, sheet music editing),
not MODs. Let me know when I can score 32nd note holds in a 23rd note riff
via a sheet-music type interface....

Last time I checked, mods were shareware -- I know that doesn't make them
less able to qualify as "software" (I have shareware stuff out there too!),
but I intended to talk about commercial software....

Yes, I know they're just X-servers but what else do you really need X for
anyway? There's no point in running Unix so you can run X when there
already is a good windowing environment for the Falcon.

The main reason I'd want to run X (and I think which is satisfied by the
X-servers we're talking about) is to get onto a network or remote connection
and run X-aware programs from a different host. For example, if I log in
to my university machine, I could run a GIF viewer from there rather than
downloading and running a Falcon GIF viewer.

Anyhow, you're right that it would be not very practical to run full-blown
X, but my point is that you don't really need to.

Comments?

Well, I have some new Mac Prices for students of higher education and street prices for mere mortals....

The Mac LCII 4/80: List price is $1049, Ed price is $799
The Mac Centris 610 4/80: List price $1859, Ed price is $1227 and street price is $1449(J&R music world). The 8/230-CDROM version is $1997 education and 2339 street(J&R)

The color classic 4/80 is $957 Education and $1149 street.

The Duo210 4/80 is $1249 Education and $1499 street(J&R)

I suppose Atari and Commodore better lower their prices and come out with new models to stay competitive...

==========
Amiga 1200/80 ----------I love it ----------

With Opal Vision ----- $699 ---------- Soon ----------
==========

: You are using 800*600 with AA chipset? Gosh! A friend of mine has an Amiga
: 4000 and doesn't consider any interlaced mode suitable for doing something
: with the machine. In his opinion these modes are just good for viewing
: pictures using ViewTek. Remember, the Falcon will do 1152*832 in 87Hz
: interlaced with the ScreenBlaster, an external hardware that is available
: for ~100 $, bundled with NVDI here in Germany for ~ 150 $ and bundled with
: a Falcon (at an Atari dealer in Hamburg) for ~ 65 cents. Not to mention
: that it gives you resolutions like 880*608 at 60Hz noninterlaced (the fewer
: pixels you have, the higher is the refresh rate).

I am aware of this, as well as how faster pixel clocks affect the speed at which you can access the memory in a Falcon (with a greater and greater amount of time being taken up by the graphics subsystem to fetch the necessary data).

However, one must ALSO be aware that a) as memory access gets slower, so does the available CPU resources, and b) after a certain point, there is little worth in adding resolution to an image.

There are roughly 525 scanlines in an NTSC image, including overscan space. Anything over that is nice, but frilly, and on either system, Falcon _OR_ Amiga, you take bandwidth to memory.

Of course, the difference is, the Amiga has always had a corner for the CPU to "back into"--the FAST ram, that ram which is inaccessible by the chipset. The Falcon isn't set up that way. Computationally, it's an Amiga advantage, and one that could be a great help when it comes time to do some heavy multimedia.

: Yeah, like 1440*256 or 800*300 noninterlaced (add some percents for overscan
: if you feel like it). Interlaced modes might be great for viewing pics or
: similar, but they are virtually useless for any other purpose.

That depends on your application. If you're developing multimedia kiosks, it may be a big advantage to use a single monitor, a high-quality tv-like monitor, and pump your VCR, VideoDisk, and system/computer output through the same monitor, using the computer to moderate which gets shown, and when; this is EASILY possible on an Amiga, and it's been done for a long time. That's where interlace becomes an advantage, and it's why the Falcon has magically picked it up.

And that's where the advantages of the many modes of the Amiga can be your best friend.

To think of it as useless for anything but pictures is foolish as well, because this is multimedia, specifically, that we're talking about--much of it IS pictures; pictures and animations, something the Amiga is better suited to.

After all, that's our forte', here. The Falcon has its 16-bit audio, and the Amiga has its graphical prowess.

That DSP is also what takes those 8 channels of audio and squeezes it
into the actual number of physical channels, two. Without it, your CODEC
is just a glorified two-channel audio system. Simply NOT adequate for
multimedia--that gives you a digitized soundtrack, and NOTHING more. It
doesn't even allow you to make better use of your resources and use
"composed" music, through samples, like mods do.

Without that DSP, there is little to no use for having 16-bit audio, and
you may as well go back to STe hardware, where you can make better use of
system resources.

Amiga may have been the first to use and create .MODs but once everyone else adopts the standard, it isn't who developed it that counts anymore, but who does it the BEST.

And if your music software is just .MOD players, that maybe be ok for some consumer level multimedia, but if you want to get into professional audio, I really think the Amiga would not be on the list of a recording engineer. :)

First, let me say I'm a bit surprised at the turnout. Boy, there are a lot of people to argue with. Again. :)

Second; I'd like to say that I REALLY, REALLY don't like that subject. But for the sake of thread completeness, it stays.

: You seem to be implying that the Falcon can't do sound at the same time as
: it does anything else. This is absolutely incorrect. Let's just point out

Definitely NOT.

: some facts about the Falcon that seem to have been overlooked :

: 1) The DSP has _nothing_ to do with recording and playback of digitized
: sound, except for adding special effects which are entirtely
: optional and a separate issue.

Those special effects also consist for the combining of logical channels into physical channels. Without the DS you have two-channel audio, and that also means that you're stuck doing simple digital playback; which is most often NOT what you'd want to do in a multimedia system. A DSP would allow you to use "composed" music, such as mods, and allow you a much greater range of audio abilities; on the Amiga, much of that ability is a part of the Amiga's Paula chip--8-bit audio, with an additional 6-bit volume level. Done properly, you get a simulated 12-bits of depth.

: 2) The Falcon can record stereo (2-channel) 16-bit audio directly to the

I'm aware; we are speaking purely from a multimedia setup, which is the point of this--someone made the claim that the Falcon would be as good or better a choice for Multimedia, and I'm disagreeing. Rather vociferously, I might add.

: So, to sum up, you could start a stero 50KHz (AND 16-bit) 20-minute song
: playing from the hard drive and then let the CPU go do something else with
: very little slowdown. I think this just about covers any of your complaints
: about the Falcon's audio capabilities.

And would you think that's anything like a good solution for multimedia? I don't even think it RESEMBLES a good solution. A 20-minute song sitting on some huge trilobyte hard drive is NOT a funny idea, especially not for multimedia. And I _CERTAINLY_ hope that the rest of your multimedia needs are already in ram, or you'll have to try to use that

hard drive during that direct-from-disk stuff for other tasks.

From a multimedia perspective, that's a really, really bad idea, and I'm surprised you mentioned it.

: I don't think you could really argue that any Amiga has better built-in sound
: than the Falcon does, nor does any other computer on the market at this

I didn't. In cases like this, I usually advise a pair of aspirin (or Tylenol (tm)) and a quick perusal from the replied-to message. I simply said that from a multimedia perspective, there is too great an overhead to use the Falcon's 16-bit audio when the multimedia presentation is at the boundaries of what can be done with the system. The Falcon's advanced audio system isn't incredibly useful without that DSP, and the closer you get to doing things similar to an Amiga with that 16-bit depth, the more strain you put on the system (whereas on the Amiga, there is very, very little overhead with such things).

: point. It seems to be the case that the Amiga is best suited for video
: applications and the Falcon is suited for audio applications, which makes
: sense if you think about it -- each company is trying to capitalize on their
: biggest niche market right now, although either system is pretty good
: overall.

Agreed. I don't think the Falcon is a bad system; I just don't like the way Atari crippled it. The once proud Falcon is more like a chickadee in a wheelchair compared to what accounts originally were giving to it; this was before we found out it didn't have a bus, before we found out about the narrow pathways... before this, before that... etc.

Old ST mod players is obviously all you've ever listened to! STe (and TT)
mod players all sound exactly the same as Amiga MOD players - for the simple
reason that the hardware is almost identical. In fact, the MOD player I
have on my TT sounds even better than on the Amigas, because you can enable
the interpolation option and 50KHz sample rate (which chews up CPU, but
really makes for high-resolution sound - interpolation uses CPU a LOT).

## 324. IGNORANT Amiga users

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-20 02:31:25 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993May20.023125.4609@ultb.isc.rit.edu>
Source record: 22959

I really love this base because it lets Amiga users really prove to themselves what a little drop in the bucket they really are to the rest of the computer world. They have to fight over the, 2% of the market share with their only other competitor, ATARI. Let's face it folks, as good you might think the AMIGA is over the ATARI (true or no) you can cut the act that AMIGA is some sort of huge force in the computing industry with the best hardware in the world, yada, yada, yada. Talk about an infiriority complex! This base was created for AMIGA users who are so paranoid about their computer's popularity, they have to go crazy in the ATARI group. In fact, I'll bet half the .advocacy groups were made because of silly little ranting Amiga users. Sheesh.

Yeah, I know this is the advocacy group and it's for ranting but I really grow tired of these AMIGA users pretending like they have a CRAY sitting on their desk or something. WISE UP! If you folks have to spend your time comparing the FALCON 030 to some of the best computers in your line then that's sad. The Falcon 030 is a CONSUMER MODEL. Wheather ATARI ever intends to release another "high end" model is a moot point. The F030 was designed for the consumer to toy around with. That means the 16Mhz 030, the "crippled" CODEC and the "crippled" bus and the "crippled" this just goes to show that a little "crippled" consumer model is basically in the same league with some of your best Amigas. Oh, I'm sorry, you have a slight edge WOW, thrilling.

People complain about "ATARI Cheerleaders" but let's face it, the guys who are wearing the skirts and pom-poms are the AMIGA users. A sorry lot of people if I ever saw one.

*Disclaimer*
Is that .advocacy enough for you? :) Really, I do think that all computers (even the AMIGA) have merits but I just can't stand all the bashing from people who don't even deserve to DO any bashing. It's all so pointless. Just use what you like!

BTW, replying to this message is rather pointless since I'll be leaving to go home from college soon. Happy Advocating!

Ok, first of all I wasn't especially thinking of multimedia when I referred to the Falcon's audio capabilities, I was thinking more of exclusive audio use. That issue aside, I'd like to hear more about the kind of stuff you've mentioned with respect to multimedia sound. What exactly is it that needs to be done with the sound other than playing it back and stuff? I don't know a heck of a lot about MOD players but there are several excellent ones for Atari computers (most work better with at least DMA sound), and they don't seem to take a heck of a lot of processor time...

For example, what abilities are you speaking of when you say the Amiga allows a "much greater range of audio abilities?" I must confess I don't know much about the Amiga hardware but it seems to me the Falcon could do this pretty well too.

>
>Agreed. I don't think the Falcon is a bad system; I just don't like the

>a wheelchair compared to what accounts originally were giving to it; this
>was before we found out it didn't have a bus, before we found out about
>the narrow pathways... before this, before that... etc.

Again, it's the old tradeoff between features, power and price. If I were to design a Falcon-like computer I'd probably want the full 32-bit bus, maybe a dual bus for graphics, with some exclusive video RAM, etc. However, all of these things add to the cost and perhaps the design time of a system (in the Falcon's case, I think some of it may have been the result of compatibility issues). It's the same with the Amiga 1200 -- why does it have a 68020 instead of an 030? Why the single

piece case? There are always compromises that must be made, and I don't think it's fair to keep comparing a base-model computer with some idealistic top of the line workstation.

Even though there is no OS2 driver for the GUS, you can still run
almost all the native GUS software in a DOS session. The only GUS software
that doesn't work under OS2 is SBOS. That's ok by me, as SBOS sucks to
begin with. I have both GUS and SBPro installed in my machine. GUS for
mods, midi, or 669 files and SBPro for games. Best of both worlds.

Message-ID: <1993May20.132054.21234@ryn.mro4.dec.com>
Source record: 22970

This newgroup cracks me up. I own two aging Atari ST systems and am somewhat interested in buying a Falcon so I don't have to repurchase all my software. Is the Falcon the greatest computer ever? Nope. Is it a better value than a Mac, 486 or Amiga? Not really, although none of those machines will run any of my software 8^)

Not all users care about all the gee-whizzy features people love to argue about. I do some word-processing (heck, I still use First Word, for pete's sake, because a magazine I write for can accept articles I e-mail them in that format), I balance my checkbook with Phasar, use a homebrew database and have some MIDI programs for use in my home studio.

I have *NO* hard disk, I still use TOS 1.0, have only 1 meg of memory, etc. Pretty boring, eh? Hey guess what, I get all the tasks done on these machines! I have no real need for a faster, whizzier machine. Why the Falcon is cool for me is that for the price of a hard drive and a (buggy) memory upgrade, I'm over halfway to buying a Falcon anyway. Plus I would get a brand new machine (not one I need to keep repairing because it's seven years old already), faster processor, improved OS, digital audio recording (which could be cool for my home music stuff), etc.

If I buy any other machine, I have to buy a bunch of new software (even a new printer if I get a Mac) plus a MIDI interface, etc. For my needs it doesn't make a whole lot of sense. I suspect that there are quite a few others out there like me, they just don't post to this group 8^) 8^)

BTW, I have used UNIX, DOS and Mac machines (not to mention CP/M and TRS-80) on the job over the years so it's not like I've never seen what other machines can offer.

Well, this difference is not essential(!) to me. The only thing interesting
to me (and about 99.9% of the other users, IMHO) is if the resolutions are
available and supported by the OS, not how they are made available.

It sounds like a waste to me also. However it is just one example of how
poorly defined Multi-Media really is. Although I truly like Atari computers
better than most. I would choose an Amiga if I had to CREATE a multi-media
demo right now. If some of the reported genlocks and special effects add-ons
for the Falcon actually materialize, then I might change my mind.

To play a multi-media demo/program/whatever I really do not care much
about the machine it runs on, as long as it looks, and sounds the way
the demos creator wanted it to.

Since I already own a TT, I would probably get something like the NovaCard
to get all the video features of the Amiga. A bit pricey, but it would do.

"it" clearly refers to direct-to-disk sound recording. Sorry you seem to
have made some connection with an alternate reality :)
It (that tricky word again -- we are referring to the direct-to-disk
recording again) was stereo 8bit 15kHz, more like....

Should this be used in a studio? No, of course not, I wouldn't dream of
suggesting it. I also wanted to make sure that the discussion didn't
drift into "the Amiga can't do disk-sound recording at all", which is just as
lame.

whats so difficult to believe about a parallel port doing 110Kbytes /sec??
give or take some depending on the overhead.

Who said I was using PC .MODS? All .MODS are created equal, but not all .MOD players or .MOD playing machines. If you can pull of DAT quality sound on your, what, A500, then I'll bow down and praise the Amiga god. Until then....

S H U T U P A B O U T T H E S O U N D B I T ! !
Amigas had an advantage in sound when they first came out, they don't anymore. I can get the exact same quality of sound that your Amiga can produce with a $100 PC card, or a stock STe. I can get _much_ better sound from a $200+ PC card, or an F030.

I'd send you a tape of this 466 with the Maestro, but the tape couldn't pick up the quality. I could send you a 44kHz .WAV recording, but you couldn't play it back either. If you'd like, just come up here and I'll show you.

Yeah, and for a $200+ Amiga card, I can better that again. The point is, MODs
are treated like some sacred God of (non-professional) music, and most of them
originate on the Amiga. OKAY?

> I'd send you a tape of this 466 with the Maestro, but the tape couldn't pick up

Try me. The Indigo we have here does CD-quality sound quite nicely, thanks.
So just UUencode it and mail it. What's 466?

Nix. I know next to nothing about Amy sound cards, pricing etc. I know you
can get 16-bit, high-quality cards at an affordable price, though, but I try
to talk about things I know about (most of the time).

>analog conversion at that resolution.

I guess you've never heard the sound quality of a Gravis Ultrasound. The other PC soundcards lose bits of information when mixing digital signals, i.e. playing a .mod on a SBPro or a PAS16. The GUS can digitally add up to 32 16bit channels without losing any quality, which lead to a huge discussion on c.s.i.p.soundcad about whether or not it had a 21bit DAC. Either way, the Ultrasound truly does rival a CD player in terms of audio quality.

Actually, I think the GUS sounds better than an Amiga at playing back mods. Most of you will probably think I'm full of sh!t, but A) I have my GUS hooked up to a full blown hi-fi system so I can hear every (im)perfection in sound output quality and B) when the GUS isn't using all of its 32 voices at once, it takes the unused portion of it's mixer's processor time and uses it to oversample (like a CD player) what few voices it *is* playing back. Oversampling might not do much to the sound quality of a CD player, which already uses 16bit 44.1khz samples, but it actually does help a lot for the less resolution in mod samples. And yes, I used to own an Amiga 500 for 3 years hooked up to the same stereo that my GUS plays through now, and I believe the GUS sounds better for mods.

Bottom line: I'd much rather have an "Ultrasound for Amiga" than a DSP chip. I think it can reproduce better sounding music for less money than a DSP can.

: >SIGNIFICANTLY less than the number of resolutions on the default AGA
: >system. And since we're talking about multimedia, it's likely that
: >you'll be using default capabilities, not ones you hand-code.

: Ehem, correct me if I'm wrong, but don't the Amiga monitor drivers reside
: in devs:monitors?????? What is the essential difference between a monitor
: driver in devs:monitors and one in c:\auto? And second: how many resolutions
: do you use frequently when on the workbench screen?

As an answer to your first half... The Amiga SHIPS with a rather HUGE amount of resolutions--enough that one is literally at first a bit lost. There are a LOT of them. I'm not referring to resolutions you program, in that case, which was clearly stated, but those that the average user would access--those which are shipped with the system.

As an answer to that last part: That's pretty lame. You have one resolution on a workbench screen. Of course, the nice part is that with the Amiga, you can have and use as many screens of differing resolutions as you like.

And since we're talking about multimedia, it could EASILY be to your advantage to make use of that. I'm sure I don't have to spell them out for you.

Please, let's try to keep the stupid and pointless posts to a minimum: Regardless of the subject line, I do NOT believe that this should degenerate any further. If you'd like to have a good argument with me, that's one thing. But to reduce it to lame remarks and name calling would be something I have no wish to partake in.

: It sounds like a waste to me also. However it is just one example of how
: poorly defined Multi-Media really is. Although I truly like Atari computers

Even without using the dreaded word, in ANY case where you'd like to present the best possible front with the least amount of requirements, the LAST thing you would want to have to do is rely on a digitized sountrack being played back; composed music would give you only slightly less (if any) quality, and would give you a GREAT DEAL more resources to work with--that is, on the Amiga; not necessarily true on the Falcon, because in order to make good use of that, you'll need to use the DSP, and that can drain your resources.

: better than most. I would choose an Amiga if I had to CREATE a multi-media
: demo right now. If some of the reported genlocks and special effects add-ons
: for the Falcon actually materialize, then I might change my mind.

None of which compare to the things available for the Amiga, I'll have to say. If you want special effects, god knows that there are enough packages now--and I'm NOT referring to the Toaster here. From both a hardware and a software perspective, if you're talking about video, the Amiga has the Falcon beat; whether we talk of reality or vapor.

: To play a multi-media demo/program/whatever I really do not care much
: about the machine it runs on, as long as it looks, and sounds the way
: the demos creator wanted it to.

1) If we're talking about a kiosk, the most important thing to remember is that this isn't a one-shot, one-play deal; a kiosk is the collection of hardware needed to run a multimedia (we'll call it a demo) demo.

: Since I already own a TT, I would probably get something like the NovaCard
: to get all the video features of the Amiga. A bit pricey, but it would do.

And if you needed to set up several systems to do that? Let's say you make a training presentation, and you want to set it up in your business--you'll need several kiosks. If your choice is between an Amiga 1200 and a TT, both with, let's say a 50MB hd (or perhaps just a CD player if you wish to have a CD of your presentation mastered), guess which you'd rather buy in quantity?

On top of that, you'e got to wonder what kind of Amiga it would take to get you all that the TT could have handled.

And, by the way, the program you mentioned is a rather sickly program compared to modern authoring programs on the Amiga. There's some nice

stuff out there.

In article <1993May20.043434.27182@beaver.cs.washington.edu>, Ben Gilbert (bgilbert@cs.washington.edu) wrote:
: Ok, first of all I wasn't especially thinking of multimedia when I referred
: to the Falcon's audio capabilities, I was thinking more of exclusive audio
: use. That issue aside, I'd like to hear more about the kind of stuff you've

Exclusive audio isn't much of a thumb though, is it? I mean, unless your particular application for the system is for exclusive audio usage, then you're not really pushing it, are you?

: mentioned with respect to multimedia sound. What exactly is it that needs
: to be done with the sound other than playing it back and stuff? I don't
: know a heck of a lot about MOD players but there are several excellent ones
: for Atari computers (most work better with at least DMA sound), and they
: don't seem to take a heck of a lot of processor time...

And on the Amiga, they take next to NONE. I've seen macs spend over 50%. I've seen Falcons do it, and it' not at all as low as the Amiga's.

Basically; it's using samples playd back at different speeds and pitches to create music, at its core. The ADVANTAGE is that your 20 minute soundtrack takes 200k, rather than 200MB. You no longer need an OM drive to store your music.

: For example, what abilities are you speaking of when you say the Amiga
: allows a "much greater range of audio abilities?" I must confess I don't

We're not restricted to specific, hardwired playback rates. We've got a full 8-bits of information per channel, as WELL as 6-bits of volume control per channel, which gives you roughly 12 bits of resolution. Most mod players outside of the Amiga either ignore that 6-bits of volume, or try desperately (and usually fail) to do it.

: know much about the Amiga hardware but it seems to me the Falcon could do
: this pretty well too.

It CAN. But it cannot do it with nearly as much finesse as the Amiga does. Why? Because it's done in our hardware at very, very little cost, resource-wise.

: Again, it's the old tradeoff between features, power and price. If I
: were to design a Falcon-like computer I'd probably want the full 32-bit
: bus, maybe a dual bus for graphics, with some exclusive video RAM, etc.
: However, all of these things add to the cost and perhaps the design
: time of a system (in the Falcon's case, I think some of it may have
: been the result of compatibility issues). It's the same with the Amiga

The lack of a "fast" bus is a compatibility issue, yes; if they wanted it to be ST compatible, it was a much easier thing to do. But a full-32 bit bus was crippling, and it gets them nothing.

: 1200 -- why does it have a 68020 instead of an 030? Why the single

Simple. Because the 1200 ships with only chip ram, and chip is uncacheable, the 68020 is as good a choice. Without its cache, the 030 is very, very close in speed to the 020, and the 020 is much, much cheaper.

: piece case? There are always compromises that must be made, and I
: don't think it's fair to keep comparing a base-model computer with
: some idealistic top of the line workstation.

I'm not. I was speaking from the vantage point of a 1200. Not exactly a top of the line workstation.

The things I speak of aren't high-end doodads; I referred to Paula, which exists in ALL amigas. I referred to the FAST bus, which exists in all Amigas, though isn't necessarily populated. On a 1200, one can easily drop in some fast ram and go (of course, it's just as easy to add a real 030, and get a big boost in performance).

The Falcon's 030 isn't getting much performance gain over the 1200's 020. It would have to have dedicated ram for that, and it simply doesn't.

No use in having DSP-less 16-bit audio?

Do you own a CD player, or do you just listen to MOD files
all the time, because your ears can't tell the difference?

^^^^^^^^^^^^^^^^^^^^

And only few of them are used, depending on the monitor you have hooked to
your 4000/1200, and the resolution used mostly on Amigas with AGA chipset
is dblNTSC, if you don't make multimedia and need the interlaced highres
modes. In fact, I have yet to meet an Amiga user doing multimedia, and I
know several of them. At least the local IEEE Amiga group is more interested
in graphic cards like the Picasso, and these cards are incapable of doing
video work, as far as I know.

>There are a LOT of them. I'm not referring to resolutions you program,
>in that case, which was clearly stated, but those that the average user
>would access--those which are shipped with the system.

The average user of a Falcon would use the noninterlaced mode with the
highest resolution (640*200) or VGA 640*480.

>As an answer to that last part: That's pretty lame. You have one
>resolution on a workbench screen. Of course, the nice part is that with
>the Amiga, you can have and use as many screens of differing resolutions

Yep, a screen concept is a great advantage, if used properly. I just can't
see reasons for opening screens in so-called 'standard applications'.

>And since we're talking about multimedia, it could EASILY be to your
>advantage to make use of that. I'm sure I don't have to spell them out
>for you.

Sorry, but I am not interested in multimedia. I am just searching for a
computer that is e.g. able to use graphic cards as a standard output
device (if RTG was available, this would be true for the Amiga, but it isn't
yet), good sound (the ST sound sucks, really) and high resolutions (and as
I have stated earlier, there are bundles available containing NVDI, an
output speedup/ROM replacement, and the ScreenBlaster or a Falcon and
a ScreenBlaster. I do not consider 8bit graphics an ideal, but at least
I won't have to buy an expensive graphic card w/ VME->Falcon interface.

>Please, let's try to keep the stupid and pointless posts to a minimum:

I am not interested in name-calling, either. It just bothers me when some
people state 'the ***** can't do this or that', if it isn't true.
What would you say if I stated 'the Amiga can't read/write IBM disks'
or 'can't do memory protection', etc.?

Well, we are talking about two different things...
The Falcon is able to sample 16-bit-Sound at 50 Khz and to put it directly on
the harddisk not only in the memory! So, if you have 1 GByte free on your HD youcan sample
a 1 GByte-File... (lets see how you manage this with your Hardware
on the Amiga :).

Ciao, Heiko.

Yes, your absolutely right! You can add an external clock to the DSP-
Interface and the TOS will be already prepared for it. But this isn't a
build-in feature of the Falcon and i've only mentioned facts about the Falcon
without external hardware (even if this hardware would be very very simple).

Ciao, Heiko.

You are absolutely correct! The CODEC only handles 2-channel Sound (but you
can add the 4 channels of the old 8bit-STE-DMA-Sound if you need more...).
Do you really think, these MOD-Files are enough for true Multimedia? Please,
compare them to the sound-quality of an old tape-recorder! I think both (the
Falcon and the Amiga 12000) are not able to produce really satisfying
Multimedia-Applications, you'll have to invest much more money to gain that.

Ciao, Heiko.

I don't want to start yet another argument, but most Amiga graphics cards CAN be used for standard output these days. They just provide a new monitor driver for the monitor drivers drawer, and whenever the user is asked to select a resolution, the new modes appear...

You can run Workbench in them, and any other Display Database app. SHOULD work. (Saw a Retina at the Format Live show. Nice card.)

Robert Brown.

1) this WHOLE discussion was in the context of a multimedia environment. If you can't handle that, we can change the subject, fine.

2) the one place that everyone here will agree to (in .advocacy) is that C= is actually MARKETING the Amiga in the multimedia market, and that is where C='s resources are heading; that is where the joint venture between NewTek (of VideoToaster fame) and C= is going to push (as well as the DTV market).

Just because your friends don't use it for multimedia doesn't mean it's not a major focus of what C= sees the Amiga becoming both now and in the future.

(as a sidenote, multimedia does not NECESSARILY require interlacing; one can combine everything on the computer's high-resolution display as well. However, it is a distinct benefit to NOT be forced to convert the normal outputs of such things as VCR's and laserdiscs into an output compatible with the resoultuions in use; better in many cases if the computer can work in the resolutions of the other devices. "Digital Video" can make use of high resolution displays as well, naturally, but if you'd like to combine many types of media (kind of a self-serving definition), then you want interlace)

: The average user of a Falcon would use the noninterlaced mode with the
: highest resolution (640*200) or VGA 640*480.

Multimedia means combining elements to create a single presentation; on the Amiga and the Falcon, those elements may not all need or require the same resolutions and depths, and advantages are gained by letting them work in their native environments rather than imposing overhead upon them.

: Yep, a screen concept is a great advantage, if used properly. I just can't
: see reasons for opening screens in so-called 'standard applications'.

You mean "real life work"? You can't see a point to grouping your applications? I prefer to have my "CodeBench" screen, where ALL of my development tools have their windows open to; including my compiler, debugger, a shell window, and all of my debugging tools.

It's of GREAT advantage to be able to create separate and independent environments for grouping applications by function and purpose.

And that isn't the only example. I haven't even begun to discuss my TeX stuff.

: Sorry, but I am not interested in multimedia. I am just searching for a

I am. I'm interested in applications like multimedia mail, I'm interested in hyperlinked documentation, I'm interested in LOTS of things that could make my life as a user AND a developer easier. And that's what multimedia could mean for me.

: computer that is e.g. able to use graphic cards as a standard output
: device (if RTG was available, this would be true for the Amiga, but it isn't

>huh if you think your machines are so shit hot.. (you've got the chance to
>steal some of Amiga's steam.. Do it!! to hard huh? losers. ;-))

I can inform you that there is an 8 channel tracker for Atari that's called
Octalizer. There is also something called EPSS that has from 2 up to 16
*polyphonic* channels depending on what CPU you have and what playback
frequncy you want, but normally you use 8 polyphonic channels in 25KHz,
and that's on a STe. If you make a Falcon specifik replayroutine using the
DSP I would guess that you could squeeze out approx 32 channels.

[stuff deleted]

'nuff said! ;-)

Actually, the discussion started with someone claiming the Falcon was
an expensive paperweight as a computer. Multimedia was just something someone
claimed the Amiga 1200 could do better than the Falcon, and like drowning
people on the Titanic, every Amiga owner then began to discuss the beauty
of the .MOD file. :)

The original topic was why someone would even *buy* a Falcon, and I originally
pointed out (lo these many hundreds of posts ago) that the Falcon, due to its
16-bit digital audio capabilities vs. the Amiga's 8-bit audio capabilities
could pump out superior sound quality.

Lately, some posts stated basically that "yeah, but the Falcon is just going
to do sample playback" which would eat up tons of disk space, and that the
tracker method was more efficient.

One obvious thing I think everyone forgot is that a lot of multimedia machines
play music back straight off their CD-ROMs as well.. but this is something
that can only be done on playback, and not during creation.

I'm not clear what you mean by this... do you mean to say that there is
an overhead imposed on doing non-standard resolutions on either or both
machines? I am not sure this is the case with either one....

That is where we are subjective.

I play around on professional keyboards. To me, Amiga 8-bit sound is nice,
but it's about as impressive to me as...oooh, the VIC-20 sound is to you. I
am once in a while impressed with it, or for that matter, even stock STe sound.

But it ain't no Korg Wavestation. :)

>Falcon is not as well suited to multimedia applications as the Amiga.

So far, your facts are:

1) .MOD files would require CPU time.
2) The .MOD file method is the most likely candidate for use in multimedia.

The thing to consider is that that may not be the only method. Since I'm
no PC guru in the realm of PC multimedia... tell me everyone, what standards
do PC clone users adhere to for multimedia presentation?

The reason I ask is... we know they have boards that are capable of more than
4 channels of stereo sound, and those boards sell like hotcakes. Why would
they choose to use .MOD files that were creaetd on the Amiga which would be
limited to fewer polyphonic voices than their sound cards were capable of
putting out?

There are three interactive players available--CDTV by C=, CD-I by
Phillips, and ?VDI? by Radio Shack; the last is a pseudo-Windows thing
running on a rather slow processor. CDTV/CD-I are LIGHT YEARS better.

: So it comes down to use the most cost effective tool you can find that will
: accomplish the job. And cost trade offs do include what you already own.

Very true. However, if you're going to SELECT a system to do it on, what
you already own ISN'T a factor--only what each platform offers.

And the Amiga holds the lead.

I respond to THAT, could somebody tell me what a Cubase Audio is? (Yeah, I've
figured out it has something to do with sound :P)

Yeah, you're right.
Cubase is the sequencer of choice (ST/MAC/WindBlows).
Cubase audio is that, as well as it incorporates digital AUDIO with
the sequences. It can do 4 tracks of HD-recording, and an additional 4
voices from memory, and on top of that, the DSP can add realtime effects
to the sound (echo, flanger, etc.).

Basically, it is what I have always wanted to have in my studio...:-)

Ah, but who would buy the Amiga 4000/040 now, knowing that it fetches
data from LOCAL memory at around 3.5 MB/s? That's -with- a 32-bit
buswidth! Commodore is surely guilty of engineering malpractice if
their top-of-the-line system is outclassed by 8-bit computers like
4 MHz 6502/816s in Nintendos and Apple IIGS. With that kind of
performance, I doubt the A4000 will be around by the end of the
year.

>can add the 4 channels of the old 8bit-STE-DMA-Sound if you need more...).

Oups! I was wrong! Sorry Amiga-Freaks, but the Falcon has 8 Mono channels
(that means 4 Stereo channels with 16 Bit). With the 4 channels from the
STE-DMA-Sound you will have a lot more than any Amiga...

Some posts ago, somebody mentioned that the parallel-port is able to transmit
about 110 KB/s. Standard Centronics-Ports are only able to manage about 5 KB/s!
For 16-bit 50 Khz Stereo-Sound you will need approximatly 195 KB/s!!

Ciao, Heiko.

>1000. What ever....

Let's put it this way, if you really want a computer that isn't a pain in
the butt, what's left if you take away reasonably fast things like
66Mhz 486s and Atari Falcon ??? (I'll leave the workstations out this time :)

Would you like a Macintosh, sir ???

HA HA HA...the day the Mac OS/hardware system becomes extinct I'll celebrate, *BIG*

I suggest *you* visit a dealer and *try* out every alternative on your list,
there's nothing like the real thing you know.

Check out an Amiga 4000/030, you wont regret it !!!

Ok, so the current AGA chip-set lacks some things, like chunky-pixel mode,
72 Hz vertical scan in certain video-modes and a fast serial port.

If time isn't a problem, wait till early 1994 when AA+ is released,
it's really just another extension of the original Amiga chip-set,
so if you're really after power and have a fat wallet you might
consider the AAA-chipset which should also be out by then.

The AA+ ...
---
..Eggebrecht, who worked at IBM as a hardware guy
before coming to Commodore, presented the future
hardware goals of Commodore first. First off was
the low-end chipset. He said it would be 2 chips
with about 100K transistors. As a comparison, the
ECS uses 60K transistors and the AGA uses 80K
transistors. It would address 32-bit DRAM and have
a 57MHz pixel clock. It would be very much ECS and
AGA compatible. Eggebrecht said that backwards
compatibility was very important for the low-end
stuff. You could have a 4MB floppy drive (he said
"four megaBIT", but I think he meant byte), and
the chipset would support 32-bit processors.
The memory bandwidth would be 8x what it is now,

and 72Hz refresh rates are possible in some modes.
He said it would be "easy" to do 2x the blitter
performance and a 800x600x8 bit 72 Hz modes (!).
The low-end chip set would support 16-bit truecolor,
meaning you could have 65536 colors at once, and
a FIFO'ed serial port would be part of it. The
FIFO will clear up a lot of present serial port
problems present now. Gee, I wouldn't mind
having the low-end stuff now :).
---
..The 16-bit colour will probably turn into 24-bit.

The AAA ...
---
Now, Eggebrecht continued, let's talk about the
exciting stuff -- the high-end chipset. The high-end
chipset is made of 4 chips with a total of 750K to
1M transistors. It could use either 32-bit or 64-bit
VRAM, giving it much increased performance. It would
have a reprogrammable pixel clock of 57 to 114 MHz.
The present pixel clock is 28MHz (AGA, I assume). Let
me go off on a tangent here. Apparently, Commodore's
new philosophy on systems design is to make subsystems
clock-asynchronous, so each part can be tuned to its
most optimal speed. The decoupling of the graphics
chipset from the processor clock is one example. Future
processors will also have asynchronous clocks from
the rest of the system.

Anyway, going back to the new chipset, it would also
support chunky modes, without losing its bitplane nature.
It would support CD-ROM in the form of some kind of really
fast serial line where it could display video and play
back sound in realtime. It would have framegrabbing
builtin (frame rate unknown), and screen promotion builtin.
It would have a 1Kx1K screen (I don't know if this is the
default or not). It would also have 8 channels of 100KHz
16-bit sound (sounds like overkill, no?). Supporting all
this would be on-demand DMA -- I assume this means we
aren't tied to having certain DMA channels for certain
parts only. It would be backwards compatible with the
ECS and AGA, although Eggebrecht didn't stress it as much.

The performance of this chipset is 12-20x current bandwidth.
There will be a 32-bit blitter with 8x the performance of the
present one. The system is capable of having 1 blitter for
EVERY bitplane! There will be 24-bit truecolor (yeah, now
where's my 48-bit color?). There will be some kind of
enhanced decompression stuff builtin to handle different
data types. I presume he means MPEG and JPEG. Let's see,
what else? The genlocking would be improved (no specifics).

The system is modular so you can upgrade to later chipsets. The default screen refresh is 72Hz with the system capable of 100Hz. The processor slot would be 32-bit and processor independent. He mentioned RISC processors, but said nothing more. Wow is all I can say at this point. But, he wasn't through yet.

---

The OS ...

---

Eggebrecht next went on to talk about the upcoming product features. AGA will be incorporated into all upcoming Amiga products. All future Amiga computers would be modular allowing you to add stuff like RISC processors (he said it again!). Commodore realizes that in the past they've kind of stayed apart from everyone else and haven't been keeping up. No more of that now -- Commodore will keep up with the industry, which means, Eggebrecht says, they will introduce 100MHz processors as soon as they are out. Commodore "won't dilly-dally" anymore. DSP support is coming. 32-bit SCSI-II is coming around Jan 1993, and may be incorporated into future motherboards. CDTV is going to merge with the Amiga line. We're going to get full-motion video with MPEG. CDTV itself is going to be cost-reduced and enhanced. Eggebrecht stated in no uncertain terms that Commodore still thinks CDTV is one of its most important projects. Software is going to be upgraded to handle all this.

Speaking of software, Eggebrecht also mentioned the new OS's that are going to be coming out. He stated that both compatibility and stability are their two greatest goals. Retargetability is also a major goal (he had about 5). Specifically, release 3 has all of the 2.1 stuff plus AGA support and multimedia support. 3.1 has API network extensions. I asked Allen Havemose about this, and he seemed to imply that the 2.0 TCP/IP software is not going to be released but instead integrated into the OS. 3.1 also will have file and printer sharing, and DSP support. Release 4 will be retargetable and have full Postscript printer support. I asked Havemose about resource tracking, and he said, "Not in the next version", meaning 4.0, but he said it will be in later. I'm somewhat surprised at this and I hope I heard wrong.

As to how far along these things are, Eggebrecht says they're close to working silicon, but would not give any dates at all. He didn't say much about the OS release dates. Eggebrecht and Jim Dionne said in very certain terms that the current Amigas (the 500,

2000, 3000) cannot be upgraded to AGA. Eggebrecht
gave some technical reasons for it. They include:
surface mounting of chips to reduce capacitance
when the chips are run at a high clock rate, 32-bit
access to memory, and the unsuitability of current
Chip RAM to be used. However, Dionne said that
"about a million" people have already asked him about
a power-up deal, and there will probably be one.

---

Now, I'll just sit back and watch all Falcon and Maggot-fans take this apart :)

A ColecoVision? Well... I'm a former ADAM owner (and hence, programmer... who could own something like that with no software and never write code? :) ) I can definitely see the ADAM's influence on the Amiga... yes indeed.. I remember the horrible color bleeding problem when you'd put a pixel up that would conflict with all the pixels around it.. in the old 256x192x16 color mode. Yep... this just has to be the precursor to HAM mode. :) :) :)

## 380. ATARI! HA!

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-28 01:57:08 UTC
From: en2prmm@sunlab1.bath.ac.uk
Message-ID: <C7ps45.13z@sunlab1.bath.ac.uk>
Source record: 22916
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

I knew 9 people with Atari ST's. 1 is buying a Falcon and an A500+.
2 are buying PC's. 2 have sold their ST's and bought A1200s.
One bought my old 500.
And 2 are happy with their STs.

So taken as representative of the 750,000 ST owners in the UK,
that means Atari may hold on to 1/3 of their user base, and sell
90,000 or so Falcons.

Statistics are misleading, but whatever the technical merits of
the machines are, I can produce a long list of AGA software.
C= may pull the Amiga around, but Atari lost it with the STE.

I have used a Falcon. 256 colour mode sucked big time.
I got decent speed outta the thing by dropping to 16 colours.
(What happened to 128, 64, 32? )
Then, it felt as responsive as WB 1.3 on an A1000.

Nice try guys, come back next year with one that works.

Paul Martell-Mead

You dare to take 9 ST owners as a representative?

>Statistics are misleading, but whatever the technical merits of
>the machines are, I can produce a long list of AGA software.
>C= may pull the Amiga around, but Atari lost it with the STE.

You may perhaps produce a long list of AGA software, but who cares? There is a long list of software using the Falcon capabilities anyway, since a GEM program doesn't need to be rewritten if there are higher resolutions, more colours etc. (OK, there has to be a VDI supporting the 16/24bit colour modes, but this is (should be) bundled with the graphics card/computer).

>I have used a Falcon. 256 colour mode sucked big time.
>I got decent speed outta the thing by dropping to 16 colours.
>(What happened to 128, 64, 32? )

Great, we really NEED 5/6/7bit graphics, as it is fun to have 5/6/7 bytes for 8 pixels. Really, esp. programming these modes is fun.
BTW, AGA doesn't support 6/7bit graphics either, don't you wonder why?

>Then, it felt as responsive as WB 1.3 on an A1000.

Including the crappy GUI? Why don't you use 1.0 instead, nothing compares to the original. Only those stupids not knowing anything about the Amiga are using WB 2.x/3.x.

>Nice try guys, come back next year with one that works.

*Sarcasm on*
Yessir! Nobody cares about Atari anyway. As warwick stated, it is dead, well, almost dead. Just a few, stupid, ignorant programmers (Jeff Minter, companies like Steinberg, Eclipse, etc.) think the Falcon is a great computer, but in real life, only Amiga counts. PCs, ATARIs, Macs, etc., they are soon to be pushed off the market by the mere power of C=.

Well, at least he did state that it was only nine users, rather than
making blatant pronouncements of the worldwide marketplace based on
'everyone I know' in Iowa, like a certain frequent C.S.A.Advo poster
/economics major has done many times :) .....
(Maybe I shouldn't bring up MB here... he seems to have quieted down
a little bit lately....)

Same with any software that uses the Display Database in OS 2.0 and
beyond to select its resolutions & colors.

>>I have used a Falcon. 256 colour mode sucked big time.

Sure it supports them. I know of several people who run their workbenches
in 64 colors because it provides a decent tradeoff between speed & color depth.

Not sure I understand what you're trying to say with the '5/6/7 bytes for
8 pixels' above, but it sounds like you're thinking in terms of a 'chunky'
bitmap display rather than the Amiga's bitplane-based video.

>>Then, it felt as responsive as WB 1.3 on an A1000.
>

>Including the crappy GUI?

Yes, GEM is every bit as crappy as WB 1.3. :-)

I know 4 Amiga owners.
One dumped his A2000 for a 486/25.
Two dropped it for Macintosh.
One is buying an Atari Falcon when it comes out, but will keep his A500 + DCTV.

>So taken as representative of the 750,000 ST owners in the UK,
>that means Atari may hold on to 1/3 of their user base, and sell

The Falcon felt fine to me in 256 color mode. The True Color (65536) mode did seem a lot slower on dialog redraws than 256 colors, but even that wasn't as bad as you're claiming.

By the way, was it as usable as the 256k A1000? :)

>Nice try guys, come back next year with one that works.
>
>Paul Martell-Mead
>

Or we could all by clones with really expensive video boards, and lotsa sound hardware and customize one of those machines to be what the Amiga should be... :)

I thought the 640k limit was only still imposed on DOS apps?
Can't Windows 3.xx apps use as much memory as needed?

>Oh yah, I program the darn things, and I hate every last minute.
>

Well, I used to hate programming Sun SPARCs, but... they're nice machines. :)

>You just entered the realm of the sheep...

Well, while the Falcon's away, the sheep will play. :)

Speaking of which, I've heard the dealers got machines to sell.. but
how many? If they only shipped 100-200 to the entire country, I'm going
to laugh.

Remember all this talk about 2 factories being online... and how a month
ago, machines were in going through Q/A.

I'm shocked many people can still wait.
(I think the only ones who might be justified are the MIDI users, like me :) )

Hmm, dealing with 7bitplanes is the same as dealing with 8 over here!?
Must be one of those bitplane/pixmap differences, huh?

>BTW, AGA doesn't support 6/7bit graphics either, don't you wonder why?

Gronk.
ECS, for one, handles two separate 6bit modes. AGA is capable of
emulating ECS, and I'm quite sure, handles 6/7 bit gfx modes just fine.

Why bother, when you can define a virtual screen thousands of pixels square,
and SMOOTHLY SCROLL the viewport? :) :)

And regarding the Falcon I used..

I am not lying. It was in 256 colour mode, I double clicked a hard diskicon.
Painfully, it drew the window, bit by bit. I cannot see any point in running
the desktop in 256 colours. Having used an A4000/030, I will probably
run mine in 64, with a nice demo-type 32 colour piccy as a backdrop.
And the 16 bit mode didn't impress me. The A4000 sitting next to
the Falcon showed the same JPG file in 800*600 resolution, 256 colours
and there was virtually no difference. Oh dear, I thought. only 18 bits
for the palette!!!!

Paul

I can too, Deluxe Paint AGA and Zool. Not a _single_other_ AGA program has/can/is now being shipped to me, and all my distributors are soothingly saying....soon. ;-)

And, comparing the STe to the A1200 is, excuse me, bullshit. You're comparing a brand new machine to a, what, 3 year old machine? If you've been listening here long enough, you'd also know that people are trying to compare the Falcon030 with the A4000!!!! Jeez, people.
>
> I have used a Falcon. 256 colour mode sucked big time.

And you think 256 color mode on an A1200 is speedy? You get the infamous double window. Click---Drag---Drop---New Window------------Old on Dissapears.

Excuse me. I'm sorry, but I don't think I understood correctly. The F030, with a new program out by....God...who did that? I'm not sure (BTW, if you flame me for this being Vapor Ware, I _will_ search through every single comp.sys.atari.st article and _find_ the damn thing just to show you....there. I feel beter now.)

Anyway, it uses the DSP chip to decode JPEG images. In 800x600x32k colors, I _think_ it took somewhere on the order of 7 seconds? I _really_ could be wrong on this one, but, compared to the 486/33 I use at work, it really screamed.

So, just thought I's shed some light on the subject.

Virtual screens are done on almost every platform... even Windows comes with
a large virtual screen application... :)

(I would love to see if the hardware scrolling programs on the Falcon are
much better than the STe ones as they use a new video chip in the machine)

>

Ummmmmm... if the JPG was originally a GIF that had been converted, of course
it would look the same in 256 color mode. :)

The 18-bit palette is a limitation in the normal modes.. True Color looked
really impressive.

As for the window redraws, the only time the Falcon looked slow (and the one
I saw was a pre-production model) was when we ran a picture viewer and it was
doing calculations of some kind on the image as we changed window size.

Disclaimer: As the Amigoids who post in the *.atari.* newsgroups say, I'm not here to flame, just to correct any misconceptions being spread. :)

## 393. Re: Convince me to buy an Amiga

Sounds like someone with a reasonably straight set of priorities...

: >Why would I want to switch from one company on life support to another
: >that isn't much better off. Face it, if there was no such thing as a
: >video toaster, the Amiga would be about as remembered as the Timex Sinclar
: >1000. What ever....
:
: Let's put it this way, if you really want a computer that isn't a pain in
: the butt, what's left if you take away reasonably fast things like
: 66Mhz 486s and Atari Falcon ??? (I'll leave the workstations out this time :)
:
: Would you like a Macintosh, sir ???
:
: HA HA HA...the day the Mac OS/hardware system becomes extinct I'll celebrate, *BIG*

Should just be a couple of years now, as far as new machines go. Of course,
upgrade paths will be in place for all current users. And we'll be upgrading
to RISC hardware, with a clearly-defined path to 64 bits, whereas you'll be
upgrading to AAA and still using a 68020 (tiny cache, no MMU, no floating-point --
but then, who needs that for demos, right?).

Of course, since your Amiga won't even be in the same league with Macs anymore,
it should take the pressure off you to try to justify your purchase mista^H^H^H^H^H
decision.

:
: I suggest *you* visit a dealer and *try* out every alternative on your list,
: there's nothing like the real thing you know.
:

I suggest he *try* to visit a dealer -- I'm thirty miles from West Chester, and
the closest Commodore dealer is in Reading -- a good eighty miles from me! Hey,
does C= have a company store?

Or maybe there's one just down the street, but all Commodore retailers have to
sign a non-advertising agreement before they're authorized. Gee, that would
explain a lot...

: Check out an Amiga 4000/030, you wont regret it !!!
:

: Ok, so the current AGA chip-set lacks some things, like chunky-pixel mode,
: 72 Hz vertical scan in certain video-modes and a fast serial port.

Ever notice how Amoeboids are so obsessed with video? Sprites, chunky pixels,
weird 1200x200 resolutions -- I mean, are these computers, or mutated TVs?
I understand the Video Toaster is a BIG hit with the soft-core porn producers,
though....

:
: If time isn't a problem, wait till early 1994 when AA+ is released,
: it's really just another extension of the original Amiga chip-set,
: so if you're really after power and have a fat wallet you might
: consider the AAA-chipset which should also be out by then.

Or if you're willing to wait for VaporWare, and you *don't* have a fat
wallet, appearing around the same time-frame will be the new PowerPC
Macs, which will give you the kind of MIPS Ghod intended all good little
computers to have. C='ll probably still be pushing 68020-based
machines. But hey, since the majority of Amiga users have an A500, it's
still an upgrade, right?

:
: The AA+ ...
: ----------------------------------------------------
: ..Eggebrecht, who worked at IBM as a hardware guy
: before coming to Commodore, presented the future
: hardware goals of Commodore first. First off was
: the low-end chipset. He said it would be 2 chips
: with about 100K transistors. As a comparison, the
: ECS uses 60K transistors and the AGA uses 80K
: transistors. It would address 32-bit DRAM and have
: a 57MHz pixel clock. It would be very much ECS and
: AGA compatible. Eggebrecht said that backwards
: compatibility was very important for the low-end
: stuff. You could have a 4MB floppy drive (he said
: "four megaBIT", but I think he meant byte), and

This is the guy in charge of Commodore's hardware?
My guess is he's been wearing a suit too long!

: the chipset would support 32-bit processors.
: The memory bandwidth would be 8x what it is now,
: and 72Hz refresh rates are possible in some modes.
: He said it would be "easy" to do 2x the blitter
: performance and a 800x600x8 bit 72 Hz modes (!).
: The low-end chip set would support 16-bit truecolor,
: meaning you could have 65536 colors at once, and
: a FIFO'ed serial port would be part of it. The
: FIFO will clear up a lot of present serial port
: problems present now. Gee, I wouldn't mind
: having the low-end stuff now :).
: ----------------------------------------------------

: ..The 16-bit colour will probably turn into 24-bit.

Let's hope so if they're going to stick an adjective
like "truecolor" on it.

:
: The AAA ...
: ---------------------------------------------------
: Now, Eggebrecht continued, let's talk about the
: exciting stuff -- the high-end chipset. The high-end
: chipset is made of 4 chips with a total of 750K to
: 1M transistors. It could use either 32-bit or 64-bit
: VRAM, giving it much increased performance. It would
: have a reprogrammable pixel clock of 57 to 114 MHz.
: The present pixel clock is 28MHz (AGA, I assume). Let
: me go off on a tangent here. Apparently, Commodore's
: new philosophy on systems design is to make subsystems
: clock-asynchronous, so each part can be tuned to its
: most optimal speed. The decoupling of the graphics
: chipset from the processor clock is one example. Future
: processors will also have asynchronous clocks from
: the rest of the system.

This should lead to what the IBM world cherishes as "wait
states". I mean, how are you going to hand a chip running
at 114MHz some data from a (guessing) 33MHz bus? Sure,
you'll have some sort of cacheing going on, and you'll
interleave requests among all chips involved, but you'll
suck bandwidth like a golf ball through a garden hose.
Unless these are all 8- or 16-bit chips and you're going
to do 32-bit fetches and then shift the data in -- or
maybe just tell people that they're going to have to
buy their RAMs in packs of EIGHT to fit that sixty-four-bit
bus...

:
: Anyway, going back to the new chipset, it would also
: support chunky modes, without losing its bitplane nature.
: It would support CD-ROM in the form of some kind of really
: fast serial line where it could display video and play
: back sound in realtime. It would have framegrabbing
: builtin (frame rate unknown), and screen promotion builtin.

Gee, video playback from CD-ROM. I guess I could wait until
'94 and get this from Commodore, or wait until 5:00 and go
home and have it on my Mac...

: It would have a 1Kx1K screen (I don't know if this is the
: default or not). It would also have 8 channels of 100KHz
: 16-bit sound (sounds like overkill, no?). Supporting all
: this would be on-demand DMA -- I assume this means we
: aren't tied to having certain DMA channels for certain

: parts only. It would be backwards compatible with the

This would be cool -- kind of a DMA-channel pool. How
many DMA channels does the Amiga have now? And what
uses them? (Whoops! Musta bumped my flame mode switch!)

: ECS and AGA, although Eggebrecht didn't stress it as much.
:
: The performance of this chipset is 12-20x current bandwidth.
: There will be a 32-bit blitter with 8x the performance of the
: present one. The system is capable of having 1 blitter for
: EVERY bitplane! There will be 24-bit truecolor (yeah, now
: where's my 48-bit color?). There will be some kind of
: enhanced decompression stuff builtin to handle different
: data types. I presume he means MPEG and JPEG. Let's see,
: what else? The genlocking would be improved (no specifics).
: The system is modular so you can upgrade to later chipsets.
: The default screen refresh is 72Hz with the system capable
: of 100Hz. The processor slot would be 32-bit and processor
: independent. He mentioned RISC processors, but said

A processor-independant processor slot? Smells like local
bus to me...

: nothing more. Wow is all I can say at this point. But,
: he wasn't through yet.
: ------------------------------------------------------------
:
:
: The OS ...
: ------------------------------------------------------------
: Eggebrecht next went on to talk about the upcoming
: product features. AGA will be incorporated into all
: upcoming Amiga products. All future Amiga computers
: would be modular allowing you to add stuff like RISC
: processors (he said it again!). Commodore realizes
: that in the past they've kind of stayed apart from
: everyone else and haven't been keeping up. No more

Commodore hasn't been keeping up with the industry in
the same way that David Koresh didn't keep up with
Christianity...

: of that now -- Commodore will keep up with the industry,
: which means, Eggebrecht says, they will introduce 100MHz
: processors as soon as they are out. Commodore "won't

Does that mean that we'll be seeing an Alpha-based 133MHz
Amiga any day now? 200, do I hear 200MHz? Or should I
be waiting for Mostek to unveil its new GaAs-ECL-MOS
clock-tripled 6502 at 100MHz?

Or maybe the Eggemeister meant "as soon as the supplier is
out". I can see it now....

"MAYNARD, Mass: Digital Equipment Corporation (DEC) today
announced it would be discontinuing its popular Alpha
computer chip line. The company also announced that they
would start volume shipments of their new 256-bit Ernie
series of processors.

"In a related story, Commodore Business (ha!) Machines announced
their newest computer, the Amiga/X, based on DEC's Alpha chip set..."

: dilly-dally" anymore. DSP support is coming. 32-bit
: SCSI-II is coming around Jan 1993, and may be incorporated
: into future motherboards. CDTV is going to merge with
: the Amiga line. We're going to get full-motion video
: with MPEG. CDTV itself is going to be cost-reduced and

Days late and dollars short, kids. Apple's either had this
or will have it before C= ships it, and now I hear they're
even CHEAPER (Centris 610 costs less than A4000/040) -- is
this true? Since of course there are no C= dealers in my
neighborhood, I can't compare prices...

: enhanced. Eggebrecht stated in no uncertain terms that
: Commodore still thinks CDTV is one of its most important
: projects. Software is going to be upgraded to handle all
: this.
:
[Lots more Future Perfect visions deleted]
:
: ------------------------------------------------------------
:
: Now, I'll just sit back and watch all Falcon and Maggot-fans take this apart :)

Too easy. Of couse, that's because I have a Computer that does Work, not
a Toy that does Video. Well, actually, I do have a SEGA Genesis, but that's
just for when company comes over.

But you never know -- I picked up a SuperPET for $15 at a garage sale, so now
I can play with APL. In a couple years I can probably pick up an Amiga for the
same price so I can play with video. Oh, and play MODs while I generate Julia
sets and ray-trace landscapes all at the same time. Very important stuff.

In article <1u4pvhINNo27@tom.rz.uni-passau.de>, Thorsten Guenther (guenther@kirk.fmi.uni-passau.de) wrote:
: You dare to take 9 ST owners as a representative?

Well, let's just hope they're not quite as misinformed as you seem to be...

: You may perhaps produce a long list of AGA software, but who cares? There
: is a long list of software using the Falcon capabilities anyway, since
: a GEM program doesn't need to be rewritten if there are higher resolutions,
: more colours etc. (OK, there has to be a VDI supporting the 16/24bit colour
: modes, but this is (should be) bundled with the graphics card/computer).

Correct. The same is true for the Amiga; but if you want those programs to be able to make use of what is available, you generally need to write it to be cognizant. For example, and old 16-color paint program for your ST isn't going to suddenly paint in TrueColor on your Falcon.

: Great, we really NEED 5/6/7bit graphics, as it is fun to have 5/6/7 bytes
: for 8 pixels. Really, esp. programming these modes is fun.

1) Yes, you do. Dropping the number of planes frees cycles in many modes on the Amiga for CPU use. Even if, on the Amiga, you're running out of Fast ram, there are times when you will need to access chip ram, and that means that you want to keep as much bandwidth as possible open.

Of course, this is ALSO true on the Falcon--it does help to use lower resolutions or depths. Unfortunately, on the Falcon, there is no "fast ram" to hide in from the contention, all motherboard ram is affected by it. Also, unfortunately for the falcon, you can't do much to alter the depth of the display, which provides an EXCELLENT way of reducing the amoutn of contention based upon the needs of the program in question.

2) Programming these modes isn't difficult at all. The system takes care of anything even remotely difficult, and programming for 8 isn't any different than programming for 4, 5, 6, or 7.

: BTW, AGA doesn't support 6/7bit graphics either, don't you wonder why?

Yet another tidbit of misinformation. As always, the Amiga chipset supports UP TO 8-bitplanes. That includes 1/2/3/4/5/6/7/8/HAM8.

: Including the crappy GUI? Why don't you use 1.0 instead, nothing compares
: to the original. Only those stupids not knowing anything about the Amiga
: are using WB 2.x/3.x.

Eh? Sure. While you're at it, why don't you drop back to TOS 1.0 on that Falcon of yours. If he says that the Falcon was as responsive as an A1000 running 1.3, that's one thing. Pulling strange colloquialisms out of your ass isn't going to change what he thought. If you'd like to DEFEND that position, there are better ways of doing it.

[Really, really weak sarcasm removed]

Gee, not only are you incapable of writing your own sarcasm, most of that being borrowed from Warwick, you couldn't even manage to make your POINT with it.

Perhaps we should try to clear up the huge cloud of misinformation hanging over your head. Nobody here things that the Amiga is god. Then again, nobody here thinks the Falcon is either; the flaws in the Falcon are blatant, obvious, ass-biting holes in the architecture, and they're not something you can gloss over with a shot of whiskey and a checkbook.

Well, what sort of "blatant, obvious, ass-biting holes in the architecture"
exist in the Falcon?

And believe me, any problem can be fixed with enough money. The whole
premise of the Atari (and the Amiga too) is that the machines pump out
more performance for the penny than anything else in the clone or Mac
world.

Now, we all know what a resounding success both machines have been. :)

The Falcon is a very nice machine designed, I believe, to appeal to the
musician first and foremost, and then the hobbyist computer users. I would
hazard a guess that some people will use them for the DSP and get in to
more sophisticated uses, but I wouldn't expect major universities to write
code for these over their dedicated workstations.

But for the price... it sure ain't bad. :)

That's true...but how about considering this... when a Mega ST/e/TT owner adds a graphics card to their system, it works with all the software that uses the AES & VDI.

The same holds true for a Mac or Windows application.

The Amiga claims to have device independence, right?

What happens when you throw in your video boards and your applications says to the Amiga: "Gee whiz, I wanna run in XXX x YYY mode with ZZZ bit color!" and it demands an Amiga mode that is unsupported on the card?

(but of course, works fine on the stock Ami chips... :) )

Does it just mystically work on your videoboard and try to work like it is doing that funky HAM mode on the SVGA? I think not. :)

Cool. Can I make up a story now? I know 500 people who tossed their clones,
Macs, Amigas, and Ataris out the window. Obviously, no one is using computers
these days.

I'd like to see one of those Falcon machines, though. The specs look good
for the price. What kind of software (word processing, image processing,
3D rendering, etc.) does it have? Thanks.

I've taken this discussion to mail but I want to make a few last points
to make my position clear.

In article <13627@uqcspe.cs.uq.oz.au> warwick@cs.uq.oz.au writes:
>
>If all you've done is read a few bits of advertising, what makes you think
>you're any kind of expert?
>
I never claimed to be an expert. I started this thread originally
because the falcon struck me as being expensive for what it was.
I now concede from discussion with other users, who are far more
objective in their opinions and don't resort to denigrating the person
they discuss with, that if you are specifically interested in the d2d and
dsp capabilities then the falcon is probably the best buy. I still
believe that for the price of a falcon you can get a far more powerfull
machine with better graphics abilities and upgrade potential if you go
for a 486 based machine.

I use both pc's and ST's, the pc for work and the ST as a midi
sequencer. I'm not a zealot, I use the best machine for the job. If you
can't accept people who don't believe atari is the answer to everything
then that's your problem.

Yes ! Amiga supports any bitplane deph between 1 and 8 !

Why use a 8 bit display when you need only 6 ?

Actually, one thing Amiga got right that DRI/GEM got wrong (gee, I
have a whole list of 'features')

Lesse... first, when using the window title bar to move a window, and you
hit the limit, but keep moving the mouse, the pointer still keeps moving.
Same thing with like scroll bars. Notice on the Amiga, when its at its
limit, and you keep moving the mouse, the pointer stays still...
(some may consider the opposite as correct...)

Also, has the new GEM fixed the 'move up one window' type o bug? You all
know what I mean: open a folder, and scroll down half-way so the slider
bar isnt at the top, and open another directory on into this window.
Now use the widget to close this one to move back to the original directory,
and the scroll bar is now at the top... annoying, especially for file
management...

Bzzzzzzzzt, wrong answer. The Falcon can switch to any resolution on the
fly within a program and have full AES/VDI support. This has been true
right from the start. Even the normal ST can do this, but the Falcon does
better (I think on the ST you don't get AES support or something). In fact
one of Atari's new guidelines for writing programs (including games) is that
they be installable from the hard disk and run from any resolution at all.
So, you've got a monochrome desktop up. Want to run that true-color game?
No problem, just click and go. (I don't know how MultiTOS handles this,
but that's a different issue entirely since you can run a Falcon with or
without MultiTOS)

Hmmm, so can the Falcon have two or more different resolutions available
simultaneously, or does it switch the entire display to the same resolution
and depth?

I'd still like to know some of the good applications for the Falcon.
Things like MS Word would be nice, but also affordable apps along the
lines of Final Copy 2. Thanks.

It doesn't? Gee, then it must be using an 8-bit mode for the 64/128 colour Workbench. Go figure. Think 'SAVING MEMORY', OK? If you only NEED 100 colours, esp. for big animations, using 8-bit modes are a waste.

Hold on a sec, I didn't say anything about simultaneously... :) Now how could you do that anyway? Have 320x200 in the top half of the screen and 640x480 in the bottom half? Sounds a bit weird to me...

Whatever program is currently running has control of the screen and can change to a new resolution. Now I have absolutely no (read : don't ask me) idea how MultiTOS handles programs that ask for different resolutions... Maybe there is a way to request permission to control the whole screen or something. I think the answer to your question is that it _does_ switch the whole display to a certain resolution and depth. The point I was trying to make is that this is up to the program and can change during a particular program's execution.

Never heard of Final Copy 2, but it sounds like a word processor. :)
There are loads of great WPs available that will run on the Falcon (such as Calligrapher, Atari Works, Redacteur, That's Write, etc...). I don't know how "affordable" you want, most of these programs are $100+.

It is, and it takes some getting used to, but that's exactly how the Amiga does it. Once you try it, you'll never want to go back. You can grab the title bar of your SCREEN, drag it halfway down the monitor, and reveal the screen behind it, regardless of resultion or color depth.

I don't pretend to understand it, but I believe this is also the secret behind the "Dynamic HAM" display hack - under the old graphics chipset, the 640x400 hires mode is limited to 16 colors. But, using this ability to display entirely different "screens" on the same display, DHAM remaps the 16-color palette EVERY SCANLINE, allowing 4096-color HAM on a hires screen. Just one of the innovative little strokes of genius that Amiga people have. That's one of the things that makes the Amiga so great - the people it gathers together. They are, quite simply, some of the most inventive, brilliant, interesting people ever assembled together into one "group". I firmly believe that, no matter how independant it really is of the graphics hardware, the Video Toaster could not have been designed without the Amiga - the computer was needed to bring the "people with good, high-tech brains" (from the Toaster demo tape) together into NewTek Inc.

Well, the Amiga has been able to do it since the first A1000 was released.
It's a great memory saver--all programs don't need the highest resolution.

$100 isn't bad, but a program would have to be top-notch (with good support)
for me to spend more than that. Final Copy 2 is a word processor--I bought
it for $90. What does the Falcon have along the lines of image processors,
desktop publishing, and 3D rendering? Thanks again.

So what if you switch back to GEM, is GEM in 320x200, or 640x480? (Assuming your desktop was set up for 640x480 before some program requested 320x200)

[Boring stuff about wordprocessing WIPED MERCILESSLY HAHAHAHAHAHAHAHAHAHA]

Source record: 22850

There was this person who said Multiple resolutions on the screen at the
same time sounded weird...

Well, take a look at the game "THE PAWN" on the ST. It used 620x200 for
the menu on the top of the screen, 320x200 (more colors) for the next 3/4
of the display, and 620x200 for the text portion of the bottom of the screen.

It has also been done in other programs too. Theres nothing to it,
it just takes a couple of interrupts at the right moments.

(The Amiga ain't the only computer that can do it.)

Well this isn't really the same thing. You're talking about taking one screen and using raster interrupts to re-configure it at various points. This sort of thing used to be common on the C64 BTW. What the Amiga does is have completely independant screens that can be dragged horizontally and vertically. They arent bits of one display area, but completelty independant of each other. AFAIK the Amiga *is* the only computer that can do that.

Chris Brown

If I understand this thread so far, all your saying is that you can have a
screen, where one window is one rez, and another window is another rez.
The Amiga aint the only one that can do that.

Since I am at home, and the info is at work, I cant give you definate info,
but there is a card, for the Sun SPARCs Sbus that gives you the same thing:
one window can have a totally different screen rez as another. Also, you
can have different bit depths in different windows. The add I recall had
one window display 24 bits worth of colour, and others displaying 8 bits
worth of colour (I dont recall anything less than 8 bits, like 4. seems
to me its a foregone depth these days...)

If your interested, go read up some Sun Expert mags, I think this is
where I saw it

> in the bottom half? Sounds a bit weird to me...

No, it doesn't sound weird at all. A lot of Amiga programs use this to their advantage and well. Also, the display does not have to one screen at the top and one at the bottom. There can be as many screens in the display as you want, of any height.
Here is a good example of it's usefulness: ImageFX, an very good image processing program, operates with two screens of two different resolutions. There is a full-sized screen for displaying a preview of the pic that you're working on, and on top of that, there is a smaller screen that the interface is displayed on. At the touch of the right mouse button, you can bump this screen behind the preview so that you can see all of it. Another tap brings it back. I've also used this technique a while back in an AMOS basic program and it works very well. There is no redrawing necessary, and the OS doesn't have to keep track of what's under the control panels so it can be redrawn correctly, unlike the way any system handles windows. The effect is instantaneous.
I think it sounds weird to you, because you've never seen it in use..

Amiga programs have full control of their screens as well. A screen opened by an Amiga program is totally independant of any other screen in the system.

The only time one screen wil influence another, is if you drag a non-int.
screen down, showing an interlaced screen up under it. Then the computer
will automatically "promote" the non-int. screen to interlaced resolutions,
but it will still keep the exact same appearance as it did before.

FC II is a fantastic graphical word processor/DTP program. It's best feature
is that it's capable of getting the maximum quality output from any printer.
But since it's postscript output is so good, I just send it's files up to
the school to print on their postscript boxes.

Hmm, I count 600 lines. :-) I know what you meant, though.

>It has also been done in other programs too. Theres nothing to it,
>it just takes a couple of interrupts at the right moments.
>
>(The Amiga ain't the only computer that can do it.)

True, but the Amiga doesn't need funky interrupt tricks to do it, and
doing it takes zero cpu time. I doubt the same is true for the Atari.

## 420. HP DeskJet Plus & Panasonic 1124 printers for sale

Newsgroup: comp.sys.atari.advocacy
Date: 1993-05-31 00:33:04 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1ubjo0$bn2@usenet.INS.CWRU.Edu>
Source record: 22855

I've decided to move up to color, so I need to sell the following:

HP DeskJet Plus... About two years old, works great. Includes Times Roman
font cartridge, original box and manual. Includes almost-new ink cartridge,
and an empty high capacity ink cartridge (for refilling). Must sell ASAP.
$225 plus shipping FIRM.

Panasonic KX-P1124 24-pin dot matrix printer. Six built-in fonts, three-way
paper handling. Works great, about three years old -- used it before I got
the DJ, and it's been in the closet since. Includes two ribbons.
$150 plus shipping.

Please send Email if interested.

> I don't pretend to understand it, but I believe this is also the secret behind
> the "Dynamic HAM" display hack - under the old graphics chipset, the 640x400
[..]

Yeah, what happens is the graphics system jams the display information
into what's known as a "copperlist" -- a bunch of data which the graphics
COProcessOR (Dennise/Lisa) uses to generate the display. All the fancy
stuff gets done through this wonderful copperlist -- scanline palette
changes, sprites, viewports, screens, dual-playfield mode, interlacing, etc.
Because Denise/Lisa generates a display made up of scanlines, it's really
not a lot of trouble to change how much data gets put into the scanline,
when you're dealing with the copperlist. Hence, horizontal resolution
changes are easy to perform. Vertical resolution changes can't occur
because the monitor needs to re-sync to different frequencies in order to
get more/less vertical resolution in the same amount of time. The
electron gun can't change speed while it's painting the screen, so you end
up promoting vertical screen changes to whatever's best. (i.e. an
interlaced screen promotes the whole display to interlace)

Copperlists -- enter the power.

Good point, I hadn't thought of that. I admit I have never seen this capability demonstrated on an Amiga, sue me... :-) Of course I've seen mixed resolutions in other situations (anyone remember the Atari 8-bit graphics modes with the 4 lines of text at the bottom), but I'm sure it's much improved since those days.

>
>
>$100 isn't bad, but a program would have to be top-notch (with good support)
>for me to spend more than that. Final Copy 2 is a word processor--I bought

>desktop publishing, and 3D rendering? Thanks again.
>

Well for desktop publishing there's Calamus as the frontrunner, and PageStream too (although whether or not they will release PS III for the Falcon is unknown). Also lots of other tools like Didot, Retouche, plus lots of vector tools (Arabesque, Convector, Outline Art), I think the Atari is _very_ capable in this area.

Image processing I am not too familiar with, what exactly does "image-processing" mean for a program?

For 3D rendering, Lexicor has an excellent line of products that are also portable with the Silicon Graphics machines. They have animation software (Chronos) as well as rendering stuff (Phoenix) and all sorts of graphics tools (Prism Paint, Rosetta-3D, etc.).

>your desktop was set up for 640x480 before some program requested 320x200)
>

The desktop always stays in the same resolution unless you tell it to change to a new one (although in rare cases a program will crash or mess with the system in some improper way and somehow screw up the desktop so it is not in the right resolution -- obviously programs that do this are not "well-behaved"). The program can change resolutions while it's running but when it leaves it is supposed to return the palette and everything else back to normal (I think that is another one of Atari's guidelines).

|> computers to have. C='ll probably still be pushing 68020-based
|> machines. But hey, since the majority of Amiga users have an A500, it's
|> still an upgrade, right?

If their machine is the one with custom graphics chipsets that have the built-in
mpeg decompression, your PowerPC chip based Mac would just crawl compared to that
capability. And since Apple is so notorious for not putting any copprocessors
at all to help the main CPU... tsk tsk. Now, this could change for Apple, and I admit
it, but since you have this 'stereotype-facts-opinionated' attitude, I have to
use the same sword.. can't I?

```

```

25 (yes twenty-five). I think the Mac IIFX had only 1. The current Macs I think have none, except
the Quadra I think.

|> And what
|> uses them? (Whoops! Musta bumped my flame mode switch!)

The disk drive (one of the reasons you can format a floppy on the Amiga and
*continue* working), blitter, graphics chip, copper, the dma sound engine (so it
takes far less time than a Mac doing sound), the expansion slots.

|>

Actually, the Amiga allows multiple screens of different resolutions and
depth to be displayed simultaneously. The number of windows on each screen
is limited only by memory.

>Since I am at home, and the info is at work, I cant give you definate info,
>but there is a card, for the Sun SPARCs Sbus that gives you the same thing:

Well, this is interesting, but I'm more interested in Amigas and Ataris
right now. I wish there were some place I could test out a Falcon.

>that can be dragged horizontally and vertically.

Actually, these techniques are identical.

The Amiga however, uses hardware to control the changes, not CPU
interrupts. This means the Amiga can make the context switches much
more efficiently than other machines, and hence the feature has been
included in the operating system itself such that different
applications can have there own screen. This would be possible on
The Atari (and has been done), although allowing the separate
"screens" to be visible on the screen at once would be tricky.

For those that haven't seen it, the screens all take the full-width of
the display, and are presented like windows (except they aren't really,
since they take up real memory for each screen)

This thread amuses me because it seems the Amiga's vaunted copperlist
and the ability to show more than 1 rez onscreen is wonderful.

What happens when you add a videoboard, though?

<and yes, we all know the Amiga can drive it, but can your videoboards,
which DON'T have a copper chip, do this? And how does AmigaDOS deal with it?>

It's nice to have a copperlist, but... ahem... isn't device independence also
a nice feature to have? AGA is nice now, but in 2-3 years, you may want more
resolution or colors. Then you'll plug in a video card into those machines
that are expandable enough to handle it.. and what will happen then?

The Falcon is available for demo at Toad Computers at Severna Park, MD. They have had two demo units for show for quite a while, but should have just gotten some units to sell recently. You address says you're at GWU so Toad is within range of you.

Congratulations! I truly believe you deserve some kind of prize!

This is one of the first reasonable, rant free, thought out messages I have read in here in donkeys' years... Hurrah!

Just as I thought this entire newsgroup was turning into alt.fan.bill-gates Mk.II.

Personally I am holding out on my opinion of the Falcon until I have actually seen one, but I will say this; Atari UK had better buck their ideas up a bit, or it is doomed to the same sort of market penetration of the ST, which was good but not great. (I speak from the PoV of someone who sells the beasts in one of the largest electronics retailers in the country): The Amiga 1200 has sold very well indeed, and very soon the Mac Performa is going to be seen in the same high-street stores selling Amigas & Ataris, a revelation in itself. The Falcon, however, has yet to surface, and is rapidly falling behind in the race. Atari UK are going to find it hard to catch up methinks.

>For $300?

Oh come now, of course not for $300.

Of course, the SPARC will chew the Amiga up and spit it out. My point
is that the quote 'the amiga is the *only* computer that can do
this', is that its false.

Now this is my problem with Amiga users. I have no doubts in my head
that the Amiga is a good computer, I am not that closed minded. My
problem is with Amiga users, who spout stuff like 'only the amiga
can do that!', and sneer at other machines for any reason. This is
almost as bad as the PC clone people, but they are clueless, they
genuinely belive that PCs are the only computers available.

A little story. I run a VAX 6420 here at work, with about 20gb of
disk space, 256mb of RAM, and over 300 users on a slow day. Some
Amiga weenie came in, and sneered at the thing, and said that his
Amiga can do better! Now, I know that some of you may not like VAXen
and/or VMS, but get a bit realistic: can your Amiga server various
other machines in various other tasks? My system is small, the 6420
serves my VAXstation, but I know of sites that have 10 or more VAXen
cluster together. This is what annoys me.

Now, I heard some rumors that Commodore is going to be 3rd-partying
(is that a real word?) the AXP chip from DEC, and making an AXP
Amiga. If this is the case, then I myself may consider buying one.
If the AXP Amiga is released before the AXP PCs, I will. Then, and only
then, can you compare youselves to the big guys.

For your information, there is this totally insane program called "GFA Raytrace",
and in one of the screens it had Low-rez (sort of a HAM-rez with extra colours) and it was on the left hand side of the screen.. and it had
Medium-rez on the RIGHT HAND SIDE of the screen.. so it was switching rez
halfway across the scanline! Now that's pretty insane if you ask me...

Graphics cards don't remove the AGA chips. Adding a card adds new
resolutions/colors, but it doesn't break Commodore's custom chips. The
old screens are still there.

No, but what happens when you drag the screens around on a videocard that does not have the ability to change resolutions on the fly because it doesn't have a copperlist?

Does it approximate the lower resolutions in the higher one, or does it force all applications to run in the current resolution (like every other system)?

My point is.. this is a nice feature (the copperlist) when you are using the OS on the built-in hardware of the Amiga. But when you upgrade to a video card, this resolution changing, etc.. is probably GONE.

Either that, or the cost of making a video card for the Amiga is sky-high because it would have to support this kind of operation on each scanline.

In case the architects weren't sure, the 030 really is a 32-bit
architecture.

Does that count as one?

: And believe me, any problem can be fixed with enough money. The whole

I'm not a believer in throwing money at a problem, especially one so
central as this. This is a flaw in the architecture, in many ways.

: premise of the Atari (and the Amiga too) is that the machines pump out
: more performance for the penny than anything else in the clone or Mac
: world.

How true is that? You'd like to say that the Falcon has an 030. The
only value that statement has is as a marketing term--I can stick an
R4400 on to an 8-bit bus, and use logic to make it look like the full
(64, I think--remember, the R4400 doesn't have dynamic bus sizing). How
much value does the statement mean? Sure, it's an R4400, but it's
crippled. It's misleading when unqualified.

: Now, we all know what a resounding success both machines have been. :)

:)

: The Falcon is a very nice machine designed, I believe, to appeal to the

I insist on disagreeing.

: musician first and foremost, and then the hobbyist computer users. I would
: hazard a guess that some people will use them for the DSP and get in to
: more sophisticated uses, but I wouldn't expect major universities to write
: code for these over their dedicated workstations.
: But for the price... it sure ain't bad. :)

For the price, I can get a REAL 030 machine, one that hasn't been
de-limbed. My statements aren't that the Falcon isn't functional, that's
foolish. The Falcon has good potential, and has some really nice spots
for applications to fill.

That doesn't magically change the architecture, and I'm not one to gloss
over it.

: That's funny... the JPG images I have have done well. These are all
: digitized images in 256 colors.

: Perhaps I have a magic touch? :)

I guess so; JPEG stores things in 24-bits, regardless of what you feed it. During its DCT, it converts (8x8 blocks?) into the stored information. That 8-bit picture has much rougher gradients between pixels because of the fact that you've only got 8 bits of granularity, and the DCT algorithm will suffer because of it.

Upon reversing that DCT, you don't get a bunch of 8-bit values, you get a bunch of 24-bit values that approximate the original 8-bit values, but are NOT the same. Those 24-bit values are then DITHERED down to 8 bits of resolution, and the resulting picture is generally awful in comparison to the original. The higher the compression you use, the more spectacular that difference will be.

That's the pseudo-technical reason behind NOT using JPEG on anything other than 24-bit images.

: That's true...but how about considering this... when a Mega ST/e/TT owner
: adds a graphics card to their system, it works with all the software
: that uses the AES & VDI.

Right; it clicks off anything nice you may have internally, and instead
allows you to use the graphics card.

You basically throw away whatever graphics capabilities given you by the
company you bought the system from. Not my fav. solution.

: The same holds true for a Mac or Windows application.

Well, more or less true; Windows is similar to the Falcon in that
respect, one at a time. The Mac allows you to make use of multiple
monitors viewing a single screen.

: The Amiga claims to have device independence, right?

Right.

: What happens when you throw in your video boards and your applications
: says to the Amiga: "Gee whiz, I wanna run in XXX x YYY mode with ZZZ bit
: color!" and it demands an Amiga mode that is unsupported on the card?

: (but of course, works fine on the stock Ami chips... :) )

: Does it just mystically work on your videoboard and try to work like it
: is doing that funky HAM mode on the SVGA? I think not. :)

No. Here's what happens. (I think you'll be surprised).

The Amiga has something called a Display Database. Programs ask for
resolutions from that display database (when they open a screen; if they
don't, they just appear on whatever public screen is default). The
display database is the list of all resolutions available to the system;
display cards can ADD their resolutions to that list.

So, any card that adds their resolutions to that list and provides the
proper redirection functions retargets any graphics to the board for that
resolution.

As a result, on the Amiga, you can mix and match resolutions between
display devices. Use Amiga resolutions in tandem with those on your
other display devices.

Exactly. :) Perfectly possible. Even without that though, there are ways. One just has to keep track of more than one display bitmap and swap when asked, at its core. The Amiga is just extremely flexible with that.

: Whatever program is currently running has control of the screen and can change
: to a new resolution. Now I have absolutely no (read : don't ask me) idea how
: MultiTOS handles programs that ask for different resolutions... Maybe there
: is a way to request permission to control the whole screen or something. I

But what if you've got more than one program currently running???? :)

: think the answer to your question is that it _does_ switch the whole display
: to a certain resolution and depth. The point I was trying to make is that
: this is up to the program and can change during a particular program's
: execution.

Great. Nothing like having no control over how much your display slows down your system... Anyways, that's not the point. The fact of the matter is, the person saw no point in setting your Falcon to 256 colors for the desktop, and the answer is that it may not have a choice--because there is no concept of screens, you can't divide resources based upon need--it always must be set to the highest of the requests, needlessly slowing down your other, less demanding programs.

: which DON'T have a copper chip, do this? And how does AmigaDOS deal with it?>

Magic. honestly. It works with device independence, because people are
doing it now. RTG is available for many boards.

Boards can define their screens as not being draggable. When a
screenchange happens on our chipset, it's just a copperlist change. When
it happens on the display board, the display driver for that board
decides how the board handles it. The better and more flexible your
board, the closer it gets to being exactly like the rest of the system.

It's transparent, in most cases.

: resolution or colors. Then you'll plug in a video card into those machines
: that are expandable enough to handle it.. and what will happen then?

Then, it won't be any different than now--it'll work fine.

Greg

It does when you consider that out of the box, the Falcon has 16-bit RAM
in it. But then... ahem... so does the A1200.

*Boink!*

The only difference is that C= has provided on board connector for 32-bit RAM
on the 1200. The Atari Falcon can do it (ever heard of TT FastRAM? :) ), and
the OS will support it.

(there are already expansions to take it up to 128MB of RAM from GESoft...)

For the price of a decently equipped Falcon or A1200, we could get
Centris 610s with (non-FPU) 68040s in them.

This is nice, but look at this next paragraph:

>So, any card that adds their resolutions to that list and provides the
>proper redirection functions retargets any graphics to the board for that
>resolution.
>

Let's look at the practical uses of this. For one thing, this means you
have to add the cost of hardware to do this to the card you're plopping
into your Ami. Since one of the big features we're discussing here for
the Ami that makes it soooooooooooo great is the ability to switch resolutions
in the middle of a display, so each program can have a unique "screen".

Now, this is nice, but how is this implemented in the hardware? Doesn't
this add precious cost to the Amiga, a machine which, if I remember prior
threads:

excels because so much is done on-board the computer, in the chips.

So, we're adding to the price of the machine right off the bat. Nevermind
that on the A1200, I've seen one thread here claiming they kept a clock out
of the machine for "cost reasons".

>As a result, on the Amiga, you can mix and match resolutions between
>display devices. Use Amiga resolutions in tandem with those on your
>other display devices.
>

And does this work on VGA cards plugged into the AT compatible slots?
Or is this only on the video-direct slot? And how much do SVGA-quality
cards cost that go on that slot?

Incidentally, I saw another thread on here complaining about the level of
8-bit graphics support in the current version of the AmigaOS. Am I
supposed to believe they will support this?

>

Well, let's look at this in the real world context.

The biggest penalty would occur when you run a program you'd be quite happy
to see in monochrome in 256 color mode. At this point, in hardware, the
Amiga is more flexible in that you can be doing your mono DTP and then
drag a screen, and then have that HAM mode picture pop up.

However, you're neglecting that under a windowing system, a program
can draw to its own work area in monochrome, and blit out to the main
display (be it 8 bit, 24 bit or whatever) in the window. This is what
most windowing paint programs do that I have seen. The Lexicor series
of products claim to be capable of working in 24-bits while displaying an
approximation of the display on whatever output device it is running on.

So the penalty is only on the display itself, not necessarily occurring
internally to the software.

Whether that penalty is so severe as you claim is the job for benchmarks
and for end users who own them to find out.

And now the big question: How many video boards handle this resolution switching on the fly?

And since the Ami is a mature machine, with a devoted following, I'm sure some exist, so throw out their suggested retail prices while you're at it. :)

This doesn't matter... The point is, that since the Amiga knows about
different screen modes, you can just tell it "OK, this screen is 1280x1024,
24bit and is handled by my external card. But I'd like DPaint on THIS
screen, which is 320x256, 8bit, and is handled by AGA." Then you can switch
between them with Amiga-M and Amiga-N (if your screencard doesn't support
dragging screens on the fly)... The OS will use the external card when it has
to, Amiga chipset otherwise. Who needs to switch resolutions on the fly?

What do you mean by `big guys'? If you mean multi-user systems then
AmigaDOS won't cut it - with or without the latest fad in RISC chips.
If you mean bitchin' blazin' performance, then a 68040 is already faster
than many vaxes.

Up till your last statement, what you said was reasonable enough. But
anyhow, I suppose I don't much care whether you think Amigas can or
cannot be compared with the `big guys'.

Well, the biggest penalty here is that the Falcons 256-color display is
unusable. I guess Atari included this option only because it looks good on
paper. Slooooow, is the keyword. The machine literally stops when using it.
Looks like a 16-bit bus, wasn't so smart, but letting this bus be shared by
the display was utter, utter ...

There is no support in Amiga OS for 3rd party boards yet. Any Amiga program using OS calls running on a 3rd party board is running hacked (3rd party written software) code from the card vendor replacing parts of the OS. Naturally, as 3rd party boards usually have one framebuffer only, screen dragging functions are disabled on the gfx board.

Now, RTG will fix this as every card you plug in will show up in the display database and tell the OS what it is capable of doing.

/Peter

But won't the video card and the Amiga need seperate monitors? If not, they
can't synch on the scanline. Switching between resolutions is nice, but
what we were discussing earlier was mixing resolutions.

My point was that mixing on the screen is no great thing, and it isn't a
device independent operation, and to do it adds cost to the cards.

The Amiga-M/N method doesn't change this fact.

<but I must admit, it sounds like an elegant solution.>

:)

Out of curiosity, what is RTG, and why is it causing such a stir? I just
saw another post where someon was complaining about it.

What you say is true to an extent. But hey, what's wrong with having the built-in graphics capable of that and the other plug in card incapable of that? Yeah, it would be better that the plug in card do the same as the built-in amiga graphics, but between a copperlist and none at all, give me the copperlist everyday.

False. A decently equipped A1200 is only around $1,000 (this includes 2 megs fast ram, 25Mhz 68881 FPU, internal clock and a 40Meg+ (60?) hardisk). This price is still lower than the Falcon's and by FAR lower than a Centris 610.

Well, the Amiga hardware DOES promote modes, so if you drag a 31kHz down
so a 15kHz mode is revealed, it tries to get a "best-fit" of the 15kHz mode.
But if (for whatever reason) the external display hardware can't support this,
then you simply can't drag the screen. No big deal, you just can't see other
screens when this screen is being displayed (and vice versa).

> My point was that mixing on the screen is no great thing, and it isn't a
> device independent operation, and to do it adds cost to the cards.

Yeah, but the OS has support for non-draggable screens; being able to drag
screens is not a requirement, it's a feature.

> The Amiga-M/N method doesn't change this fact.

Uh, what? Amiga-M/N and the screen-to-back gadget are there so you can
switch between screens. You don't NEED to drag screens.

And that... sucks! Anyway, you still have to alter more than 1 bit at a time
thanks to the: 1. Non-bitplane architecture of the Falcon and 2. When you move
the windows around.

No, it slows down. The whole GUI slows down in 256 colors vs less colors, that
should be pretty obvious-> happens in every computer. BTW, those 'lexicor' series
products that work internally on 24-bits while displaying an approximation I bet
are more slower than those that work with only 16 colors or 256 colors only.

>Up till your last statement, what you said was reasonable enough. But
>anyhow, I suppose I don't much care whether you think Amigas can or
>cannot be compared with the `big guys'.

big guys = mostly DEC.

First, I am prejustice towards DEC. No reason... or maybe

DEC is, what, 30 years old? In their history, theyve done many revolutionaly
things. Look back at the PDP-10. This was a timesharing system, before
IBM (supposedly the BEST, vomit) even knew what timeshare was.

The PDP-8 lead the computer revolution in the late 60s and early 70s. The
PDP-11 in the 70s. The VAX in the 80s. The AXP in the 90s... (we hope!)

Not intended as a history lession. And I dont really care about multiuser,
in this sense. What I mean by 'big guys' are the companies, such as DEC
that have lots of money to put into research and development. Up until
their recent major troubles, they have been a major mover and shaker in
the field (I think probably the peoples at like MIT and CMU might come
first, because we all know educational research money is endless :-)

: >> If I understand this thread so far, all your saying is that you can have a
: >> screen, where one window is one rez, and another window is another rez.
: >> The Amiga aint the only one that can do that.

: >For $300?

: Oh come now, of course not for $300.

: Of course, the SPARC will chew the Amiga up and spit it out. My point
: is that the quote 'the amiga is the *only* computer that can do
: this', is that its false.

: Now this is my problem with Amiga users. I have no doubts in my head
: that the Amiga is a good computer, I am not that closed minded. My
: problem is with Amiga users, who spout stuff like 'only the amiga
: can do that!', and sneer at other machines for any reason. This is
: almost as bad as the PC clone people, but they are clueless, they
: genuinely belive that PCs are the only computers available.

: A little story. I run a VAX 6420 here at work, with about 20gb of
: disk space, 256mb of RAM, and over 300 users on a slow day. Some
: Amiga weenie came in, and sneered at the thing, and said that his
: Amiga can do better! Now, I know that some of you may not like VAXen
: and/or VMS, but get a bit realistic: can your Amiga server various
: other machines in various other tasks? My system is small, the 6420
: serves my VAXstation, but I know of sites that have 10 or more VAXen
: cluster together. This is what annoys me.

Now, this is my problem with Amiga-bashers. You say "Amiga users" as if there
is only one kind. To quote, "The Amiga aint the only one that can do that."
More precisely, Amiga users aren't the only people who do that. Some amiga
owners will respond that way. Some won't.

If that's not what you meant to say, well hey, too bad. Be precise, or run the
risk of being called dense. I get called dense a lot, I don't mind so much.
The argument above about the amiga's windowing capabilities was in the context
of personal machines, not for Workstations or VAX mecha.

: Now, I heard some rumors that Commodore is going to be 3rd-partying
: (is that a real word?) the AXP chip from DEC, and making an AXP
: Amiga. If this is the case, then I myself may consider buying one.
: If the AXP Amiga is released before the AXP PCs, I will. Then, and only

: then, can you compare youselves to the big guys.

See, we're not, at least not in this argument. Some people are, some people aren't, but there is no *we* in any sense of the word.

No. The A1200 contain 32 bit ported CHIP RAM in its stock configuration.
Actually, the only way to add 16 bit ported RAM resources to the A1200 would
be to have a card designed for it which goes in the expansion port, or to
use a PCMCIA RAM card.

: Yes, that's true. Any other fascinating bits of knowledge no one else here
: knew about you want to share with me? :)

Umm, that pulling the 68000-compatible wires off of your motherboard and
putting them onto a connector doesn't make a very good expansion bus.

And not only does the 030 have a 32-bit data bus, it has a 32-bit ADDRESS
bus (not 24).

That's my point.

: It does when you consider that out of the box, the Falcon has 16-bit RAM
: in it. But then... ahem... so does the A1200.

NO, IT DOESN'T.

I _REALLY_ ought to show up in .atari.advocacy, there is a HUGE amount of
misinformation. It is FULL 32 bit ram. It is CHIP. It ships with two
megs of chip ram, yes. But the CPU, an EC020 (with 24 bits of address,
32 bits of data) accesses it at the full width.

: The only difference is that C= has provided on board connector for 32-bit RAM
: on the 1200. The Atari Falcon can do it (ever heard of TT FastRAM? :) ), and
: the OS will support it.

All Falcon motherboard ram is owned by the chipset; the CPU is
second. With the Amiga, only the first two megs is. And obviously there
ARE differences, because the Amiga's ram _IS_ 32-bit.

: Hmmm. How much have you spent on your computer?

On my two? A good bit. Mostly on my bad luck with hard drives; (I'm
looking into going magneto-optical as a solution) On the systems
themselves?

Not much. I have a plain jane 2000 with 5 megs of ram. I have a plain
jane 3000 with 5 megs of ram. I _USED_ to network the 2000 to the 3000
(using the 3000 as a disk server) before it and two floppies died, all at
once, due to a power spike that shorted quite a bit.

Anyways, unimportant. I don't believe at throwing money at architectural
problems, as the fact that I haven't chucked 040's into the machines
shows.

However, know that the A3000 can take an 040 without a hitch; there are
no huge "gotchas" in the architecture.

: For the price of a decently equipped Falcon or A1200, we could get
: Centris 610s with (non-FPU) 68040s in them.

Eww. Besides the fact that I can't stand Macs, they get on my nerves,
I'm not entirely sure that a decent 1200 would cost as much.

In article <1udp46$1kd@cville-srv.wam.umd.edu>, FLiP (cmedley@wam.umd.edu) wrote:
: This is nice, but look at this next paragraph:

I'm looking.

: >So, any card that adds their resolutions to that list and provides the
: >proper redirection functions retargets any graphics to the board for that
: >resolution.

: Let's look at the practical uses of this. For one thing, this means you
: have to add the cost of hardware to do this to the card you're plopping
: into your Ami. Since one of the big features we're discussing here for

We could use a cheapo SVGA for the point of the discussion, it's all the
hardware one would need and more.

One could interface a dumb framebuffer to the Amiga's display database if
one wished to. This argument has no force.

: the Ami that makes it sooooooooooo great is the ability to switch resolutions
: in the middle of a display, so each program can have a unique "screen".

That takes memory, nothing more. Yes, the driver must support it.
However, it can be done in many ways. If the driver wished, it could
demand that only one screen ever make use of the board. If the driver
wished, it could, upon the switch, simply fetch its information from
elsewhere in video memory.

The latter is the most likely; it's very similar to "double buffering"
under those cards. You just tell it that your screen is here instead of
there.

: Now, this is nice, but how is this implemented in the hardware? Doesn't
: this add precious cost to the Amiga, a machine which, if I remember prior
: threads:

What costs a lot of hardware on the Amiga is draggable screens; that
takes a copper. However, one can tell the OS that screens are
undraggable.

: excels because so much is done on-board the computer, in the chips.

Yup. That's one of the great things about it.

: So, we're adding to the price of the machine right off the bat. Nevermind
: that on the A1200, I've seen one thread here claiming they kept a clock out
: of the machine for "cost reasons".

Fine; but there's no extra hardware, your preconceptions are illusory.

: And does this work on VGA cards plugged into the AT compatible slots?

AT slots are dead; they take a BridgeBoard to activate. The AT slots are
sole providence of the bridgeboard. What you COULD do is pick up one of
the various AT-to-ZorroII converters and use that.

And if you wrote a driver, it would work.

: Or is this only on the video-direct slot? And how much do SVGA-quality
: cards cost that go on that slot?

It wouldn't have to; if you wanted it to pass through the Amiga video, it
would be best to do it that way, though.

: Incidentally, I saw another thread on here complaining about the level of
: 8-bit graphics support in the current version of the AmigaOS. Am I
: supposed to believe they will support this?

Yes. You are. Considering people actually do this, you know.

: No, but what happens when you drag the screens around on a videocard that
: does not have the ability to change resolutions on the fly because it doesn't
: have a copperlist?

When the driver adds those modes to the display database, it would define
them as being non-draggable. Simple.

: My point is.. this is a nice feature (the copperlist) when you are using the
: OS on the built-in hardware of the Amiga. But when you upgrade to a video
: card, this resolution changing, etc.. is probably GONE.

Non-draggable screens are possible with the Amiga chips too, and there
are reasons to use them; however, it is quite likely that most of your
average video boards won't be able to do draggable stuff, true.

However, any one with some kind of coprocessor might be able to. It's up
to the creators.

: Either that, or the cost of making a video card for the Amiga is sky-high
: because it would have to support this kind of operation on each scanline.

It doesn't have to; that's the point. SA_Draggable, False.

: drag a screen, and then have that HAM mode picture pop up.

Correct. Optimal response, based on depth.

: So the penalty is only on the display itself, not necessarily occurring
: internally to the software.

Correct. Tell me; how much faster is your lowest resolution in
comparison to your highest?

Now imagine being able to change the amount of depth in the display.
Imagine your highest resolution using up half of the time it normally
would because you only need, and hence only use, 16 colors. Let's say
you need 64. 128.

Fact of the matter is, the Amiga's flexibility is there because you can
ALWAYS get optimal response to your needs--right down to the depth of
your screen.

On the other hand, the Falcon's system is far less than optimal, being
much more limiting both in resolutions available and in choice of depth.

So, the advantage is real, and it belongs, in this case, to the Amiga.

>of personal machines, not for Workstations or VAX mecha.

OK, I do admit that perhaps I was harsh in my judgement of comparing
a desktop system to Workstations. I just answered some mail regarding
this, and will try to be more coherent...

Of course, if any user group, you get the people who say 'mine is the
best' (if not, we wouldnt have any flame wars, hence no fun :-).
Since the Amiga competes directly against the Atari, PC weenies and
Macs are out of it.

I try to stay as objective as I can. Perhaps I am a little fuzzy,
but hey... I can see both Amigas capabilities and limitations, and
Ataris capabilities and limitations. I choose Atari, because its
all set for MIDI. Since I would rather spend money on MIDI gear,
I dont want to spend money on getting a MIDI interface for an Amiga.
Plus, a non-Mega STe is quite cheap these days.

If some people dont like my choise of Atari for a computer, thats
my own buisness, not theirs, and I really dont want people to
tell me 'oh, that machine sux'. Compare it to a car, you just buy a
new car, and now someone comes up and tells you 'oh that car sux',
how would you feel?

I am not a programmer, so I dont care much about how easy the machine
is to program, if it has builtin libraries and all that stuff.
Multitasking, eh, take it or leave it. Belive me, when I am working on
a MIDI sequence, thats *all* my mind is working on: creating the music,
not bopping around in different programs. My sequencer software does
almost everything I need (but not all!), but I live with that. I dont
need my creative juices (whats left of them) doled out to more than
one thing at a time. Maybe I am odd, who knows?

Actually under 1.2 & 1.3 they did :). I think you hold down ctrl or alt or
something while moving a window and it trundles off the edge of the
screen.... only problem was it crashed when you let go, but still, the
ability was there :)

I have finished school and have to sell by 520 ST to pay my bills. The only problem is that I haven't been able to find a store that could quote me how much they are selling them for. It has 512K, an SC1224 color monitor, and an SF354 3.5" drive. Could somebody quote me a fair prize. Thanks.
Willy

X>It does when you consider that out of the box, the Falcon has 16-bit RAM
X>in it. But then... ahem... so does the A1200.

YAWN.

Both Falcon and A1200 have 32-bit RAM.
Both Falcon and A1200 have 32-bit video/chip hardware access to RAM.
Falcon has 16-bit CPU access to RAM. A1200 has 16-bit CPU access to RAM.

That's the facts, Jack.

So far, I've picked up a lot about the Ami.... :) It's amazing the techie info you can get on a machine when you jump into advocacy and flame tiny details about a box.

Anyways, I'll have to say, the RTG sounds like a nice solution to the Amiga's problems of multiple machines. On the original topic, the mixing resolutions then seems very irrelevant, because... obviously, it's only available on the stock machine, and not when you add a videocard (no one has named one that implements the draggable screen between it an a stock Amiga mode... which proves my point).

Personally, I'd have to say I'm impressed with the specs on the A1200/4000... But it's not the end-all be-all of computing.

Nope, I'm afraid you must be doing something wrong somewhere - what
are you using to convert your gifs to jpegs? I've used two pieces of
software for this. I originally used cjpeg to compress a gif, then had
a small script which ran djpeg on the jpeg, sent the resulting gif
to the scratch directory, and then ran xloadimage on it. More recently I've
been using xv 3.0 which has jpeg handling built in. I suspect that your
problem is either:
1) Taking the quality level down too low (I always stick with 70% - gives
me pictures about 20% of the equivalent gif size, with no noticeable loss
of quality)
2) Your jpeg decompression program/viewer doesn't convert between 24 and 8 bit
very well. djpeg does this really well, so I guess you aren't using it.
xv 3.0 has a selection of conversion algorithms which trade off quality
for speed.

By the way, I'm running these on a Sparc IPX under X windows, so its not
simply a "Falcon better than Amiga" thing.

Not necessarily - there's nothing to stop a program reselecting its own
resolution when it gets a window topped message. For that matter, MultiTos
itslef could probably handle this quite easily.

I'm sure I won't be the first to reply to this, but....

BZZZZZT!

The RAM on the 1200 is 32 bit wide. I don't think it's currently possible
to use 16-bit RAM on a 1200 even if you _wanted_ to.

>The only difference is that C= has provided on board connector for 32-bit RAM
>on the 1200. The Atari Falcon can do it (ever heard of TT FastRAM? :) ), and
>the OS will support it.

The difference is that Commodore has provided a 32-bit data bus to
all memory, while the Falcon's is only 16 bits wide (with a 24-bit
expansion connector).

>(there are already expansions to take it up to 128MB of RAM from GESoft...)

Ditto. Many of those expansions for the 1200 also include 50 MHz
68030s, SCSI controllers, etc. Try that on the Falcon's 24-bit expansion
slot...

*Boink!*

El-wrongo. The Falcon's RAM is 32 bits wide to the custom chips, and DSP,
and 16-bits (in the stock configuration) to the CPU (68030). Now, what this
means is that the custom chips and DSP have first priority to the system RAM
much like Amiga chip RAM...

The slot in the Falcon is A24/D16, as you stated....

>>(there are already expansions to take it up to 128MB of RAM from GESoft...)

I remember hearing about the 33mhz 68030 with VMEbus and 128MB of RAM
expansion at the CeBit '93 show. Now, maybe I'm hallucinating, but doesn't
that sound pretty darn impressive considering you think it can't be done? :)

Yes, it's pretty neat (although I have doubts about its advantages over a fast high-res screen), but it's nothing new. Atari's 8-bit computers could do the same thing (they had Copper-like hardware back in the '70's). You could set up different resolutions (even text modes) on different parts of the screen.

The Amiga did, however, nicely integrate this capability into the GUI.

Oh sure it is. You could design a board to use an 8 bit port to the
system if you wanted to. It would not be a very wise decision, given the
performance constraints involved, but it could be done. However, you are
correct...the A1200 uses a nominal 32 bit port to its RAM resouces.

What?!? Reading of the Amiga 1200 spec sheet I got from my dealer I read:

under CPU:
32-bit data path
24-bit address space

under memory and expansion:
up to 2 MB 32-bit chip RAM

under Software:
512 KB 32-bit ROM, can support 2 MB

Okay, now since the CHIP ram is 32 bit, and that's all the memory it comes
with, what are you talking about? Did I understand you? Or did I
mis-read something?

OK, this has since been pointed out to me by several people. The 32-bit
access for the custom chips & DSP should really help things, but cutting down
the CPU's access width to 16 bits will still cause that '030 to seem very
un-'030ish :)

Great, but how does it deal with the RAM on the motherboard? Still
accesses it at 16 bits, I'd imagine, kind of like the old A500/A2000
accelerators did... fast 32-bit RAM on the accelerator card itself, but
everything drops to 16 bits when it goes to the motherboard (which will
happen frequently on the Falcon since the DSP/custom chips need that RAM).

Well, the custom chips are accessing the 14MB addressable on the motherboard
via 32-bits. The CPU only accesses that memory in 16 bit chunks at a time.
Any FastRAM added, the CPU would churn along 32-bits at a time.

So basically, it would function identically to the A1200 (and this is the
iffy part) *if* there is "TT RAM" installed. How to go about doing that
involves getting a 3rd party expansion that, while it already exists,
is not the "path" Atari wants its users to follow. The A1200 has
a distinct advantage in that C= expressly placed a 32-bit slot for
this purpose.

However, if it can be done... :) it will be done :) slot or not. :)

<and it has been done... making this discussion a lot more interesting!>

Ok, this is great... but... The question of the week has to do with, does the Amiga CPU have full 32-bit access to chip RAM? If so, does this increase or decrease contention between custom chips and the CPU? This is something I'm curious about, as someone offered up the explanation to me that accesses by the CPU and custom chips on the Falcon to RAM could be "interleaved" more efficiently by limiting the CPU to a 16-bit bus to RAM that the chips can touch... whether this is true, I don't know... any sys. arch. people wanna throw out some real world numbers on this?

>under memory and expansion:

Ironically.. you could say the Falcon has up to 14MB of chip RAM. :)
Of course, all that means is that all the non-TT RAM would be wait-stated. :(

Eh. It's pretty imaginary. If they really needed the fetches, they
could have gone to page-mode, and do what the Amiga does now: Access
64-bits at a time, two 32-bit longwords; one through normal access, the
next through page-mode access.

: Ironically.. you could say the Falcon has up to 14MB of chip RAM. :)
: Of course, all that means is that all the non-TT RAM would be wait-stated. :(

Yup.

I really don't care about the resolutions of Atari vs Amiga, but don't tell
me that a crap SPARC Classic can chew anything. It's a slow, lousy machine.
I know you did not mention a Classic, but it's a SPARC and it sucks.
Actually it does not even suck. It just sits there grinding away getting
Eunuchs (Sys V) to log you in. Bleah.

## 488. A new computer can't make it.

Newsgroup: comp.sys.atari.advocacy
Date: 1993-06-02 05:38:50 UTC
From: kosmatoo@JSP.UMontreal.CA
Message-ID: <1993Jun2.053850.1888@cc.umontreal.ca>
Source record: 22772

To put it bluntly:

Based on the attitudes of many people I talk to every now and again, I have
a feeling that ANY new computer, released by ANY company, no matter how
fast and powerful the product is, if it is not "IBM compatible" or cannot
run Windows/OS.2/NT, it won't be a big seller. PERIOD. The masses won't
go for it. (same goes for apple products)

My point: It is obviously naive to think the Falcon or any Amiga will
ever become nearly as popular as PC's are now. Not even close.

Paraphrased: Don't feel bad that Atari has the Tramiels in charge,
or that the falcon ought to have 27 DSP's, 36 math coprocessors,
350 megs of 64-bit ram, and have come out last year.
Even if it did, and people ten times as smart (yes, 10 x 0 = 0,
but I digress..) were at the head of Atari, it still wouldn't
do to well, I fear.

Remember: Coors light is popular. "The Silver Bullet"

Hmm, well, there IS a difference... Consider a window smaller than the
entire screen which wants to have its own resolution. When that's in front,
the system resolution changes... But what happens to the display behind the
window? Do all the other windows resize to accomodate the smaller (say)
display, or do you just see the parts of them that actually fit on the
screen?

>is still lower than the Falcon's and by FAR lower than a Centris 610.

Aehem... 2 Mb (of your beloved fast-) RAM is not enough.
40 Mb Harddisk is too small.
68881...hm. Why not a 68882 (the 68882 with 16Mhz is faster than a
25MHz-68881!).
Internal Clock... that's great! But, every Computer has one today.
I bet the DSP-Card will cost over $500...
And we haven't even talked about that cheap 68020-clone in the A1200.
So, if you are able of calculating...

One more: the Falcon adress bus is 24bit wide not 16bit...

Ciao, Heiko.

Well, the facts are: you're all wrong
The Falcon has 64-bit memory and runs at 50GHz backwards with both joysticks

tied behind it's back with 2^48 colours on screen at once at 1024x768 pixels. It also comes with free 25 inch colour monitor, 10Gb Hard disk, CD-ROM drive, Tape backup drive and 32-bit DMA 88KHz quadraphonic surround sound. All for only $799 or 999 quid in the UK (due to bugs in Atari's exchange rate program)

The A1200 however, has 2-bit memory (in every sense of the phrase), and is complete rubbish to be totally dimissed without a thought

This is the most silly Newsgroup I've ever come across - but then I haven't seen the other advocacy ones yet...

Does the Falcon use the caches & burst mode of the '030? Seems to me
this would be a bit difficult (but not impossible) when the CPU is sharing
memory with other parts of the system. I hope it does; otherwise CPU
bound tasks won't be much faster than on a 68000-based machine...

Hi!

Now that DeskTracker has been on various FTP sites for quite a while, I wonder whether those of you who have tried it could just hit reply and stick some answers to the question below..?

Which FTP site did you use?

Which version of dtmt did you get?
[there have been 3]

When did you get it?

Did you keep it or delete it?

Either way, why?

Any suggestions for new versions?

In case you're wondering, a new version will be realeased in about a months time, with the following features:

o All-in-one ACCessory (no auto folder program)
o Changable Oscillo and Analysis window sizes
o Settings can be saved to the dtmt.inf file
o Automatically works on a Falcon!
o Total size of files down from 55K to 45K
o Several bug fixes

And possibly
? Drag icons to ACC window under MTOS
? STfm version

Thanks for your time!

David.

Well it depends on what program you use to compress and uncompress. In dos,
I found Alchemy does quite well. And in Windows, Paint Shop pro. I have yet
to test out the one for os/2. Not sure about other systems.

I sure hope so, otherwise I'd think the Tramiel's were having flashbacks
and making the Falcon 64. :) With a whopping 64k of RAM. :)

But the difference (unlike the Amiga) is that the CPU in the Falcon accesses the memory 16-bits at a time, making the CPU run slower, not to mention that it will slow down even further when there is video-bus contention.

Well, perhaps there are more things behind those scenes (and look that I said perhaps) like maybe the expansion won't be as efficient as it could. Maybe that expansion is like the A2000 expansions-> has its own 'computer on a single board' but when it has to communicate again to the computer for the hardisk/diskdrive/ parallel port/graphics/sounds it slows down a lot- it has to talk to a 16-bit bus again.

## 498. Prices, the real story.

Newsgroup: comp.sys.atari.advocacy
Date: 1993-06-02 17:13:12 UTC
From: neurom@u.washington.edu
Message-ID: <1uin38INNqkg@news.u.washington.edu>
Source record: 22783

Okay, I've done a little research and come up w/ these prices. These are street prices as I've seen them, so _please_ don't go flaming me if there's a problem. I've tried to configure both systems as closely as possible, as far as peripherals go. I'm not going to try and up the Falcon's video or the 1200's audio, and, although I _really_ should upgrade the A1200's processor, the only one I have is a 50MHz 030, and that is a bit overkill.

A-1200 Falcon030
Main CPU $599 $1,299
4 Megs RAM $110 N/A
85 Meg Hard Drive $279 N/A*
IDE Connector, Internal N/A N/A
SCSI-II Controller $99** N/A
68881/2 Socket \
Battery Clock >$189** N/A
RF Output N/A N/A
RGB/VGA Output N/A*** N/A
Decent Mouse ;) N/A**** $24
Decent Multisync $599& $599&
Totals: 1,880 1,924

So, as you see, they're just about the same machine for just about the same price. Now, since these are complete systems, for about $1,900, does anybody want to buy a 486 from me for the same price? ;) Sad, but true.

Notes:
* Yes, I know the configuration listed was a 65 meg Hard Drive, but, it is hard/impossible to find 65 meg hard drives (85's too, for that matter), and some/all Falcons that just shipped to consumers shipped w/ 85 meggers.
** This is a guess. I couldn't get the price of the GVP SCSI+RAM, so I used a guestimated price of the SCSI controller, and stuck on the price of the MBX-1200z from Microbotics. If I'm _way_ off base here, please point it out.
*** Interesting note, the A1200/A4000 need the same adapter to hook to a Multisync/VGA monitor, but the A1200 doesn't come w/ one, only the A4000. Hmmm.... (I ommitted the price of this adapter ($20), because the Commodore 1960 monitor comes w/ one.)
**** Hey, the 1200's mouse is nice, the Falcons....
& I assumed MultiSync so you could get everything out of it video wise. You could run either off your TV, so __PLEASE__ don't make this a point of controversy.
!@#$% These prices are what I have found out from talking to people, and for what I sell things for. If I'm really off base on something, please E-Mail me (once) and I will either answer you if I think you may be right, or I'll just ignore you.

>>is still lower than the Falcon's and by FAR lower than a Centris 610.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

How much of an achievement is it that a 2 Mb RAM machine with a sub-VGA display and a 68020 is less expensive than a machine with a 68040, which normally ships with 4-8 Mb RAM, SCSI, and can drive up to a 16" monitor at 16-bits of color resolution, or a two page monochrome monitor. Sure, and they're both "by FAR lower than" an SGI Crimson. So? The frightening thing is that for not much more than the price of the A1200, you can get a Mac LC III, with a 25 MHz '030, and have SCSI, toss on a cheap VGA monitor and get 16-bit color, and have a cool little machine that you can actually buy software for in stores.

Not that I have anything against the A1200 (aside from the brain-dead use of IDE instead of SCSI). Heck, I own an A2000... But mindless flaming just makes us Amiga owners look bad. Commodore has to complete in a rather up-hill battle against bad distribution, lack of software support, and negative momentum. Of course (this being the atari.advocacy group) Atari is, if anything, actually worse off than Commodore.

This is just speculation, but I bet they are 1meg x 4. Many people
have said that there are 4 of them (two banks), and I find it unlikely
that they used 512k x 8. Commodore has used 1meg x 4's in the past
(like in the A3000).

This sounds likely. However, if this is the case, you have 4 chips, each
with 4 wires coming out of it, and my next question is, how can you directly
connect a 32-bit CPU data path to 16 wires? Sounds like 16-bit access to
me...

I'm no C= engineer, but I can read a schematic. According to
the plans that came with my A3000, the chips are 256Kb x 4, 120
ns access times. There are 16 slots for them, and the bus to them
is 32-bits (two banks of 8 chips).

>me...

The organization is listed as being 512K x 32. I have not personally used monolithic parts of this density in my work, but I have utilized and designed modules to make a similar setup.
Now, the A1200 does indeed use a 32 bit port to CHIP RAM for the CPU. I have done timing tests on its RAM, as well as similar tests on 16 bit ported arrangements and they all indicate a 32 bit port on the A1200. (The tests were not done for this purpose, but their results are important here apparently) Normally with a 16 bit port and no cache interaction you see about a 50% or greater reduction in bus efficiency for a 68020 (assuming a clock which is the same as the CPU) over a 32 bit port. This was not evident on the A1200 which responded with timing indicative of a full 32 bit port to RAM.
Personally, I don't see the reason why you started this particular mode of questioning. It seems to be very much argumentative, and not at all useful in the line of conversation being held. Atari does not claim the RAM on the Falcon has a 32 bit port to the CPU erroneously...its is factually reported as 16 bit. The A1200's RAM reported as being ported to the CPU with a 32 bit data path, and this is not an erronous statement either, but rather a simple statement of its architecture.

I guess he's not. I am not. I know the A1200/4000 or AGA for that matter provide for 32-bit access to memory. And your persistence shows just how skeptic you are, than hints at the possibility that if someone answer, you still won't believe in the answer.

Ummmm.. who says it goes in the 16-bit slot? (which would only address 16MB of RAM as it is 24 bit address as well)

:)

No...the 68882 is fully compatible to the 68881 (and it has the same instruction-set). Most instructions will run at double-speed WITHOUT using the 68882's capability of parallel-processing.

Oh i've forgotten the SCSI II interface (worth $150)...

Please, don't forget: YOU have mentioned the A1200 cheaper than the Falcon 030. I'm only trying to show that this is not obviously the Truth.

Ciao, Heiko

Hi,

The thread concerning the technical merits of the Falcon and A1200 are becoming slightly boring (and I'm a computer science student), are are not entirely relevant to the end user.

A real test of system performance, instead of performance on paper, would be to compare the kind of programs and demos available for both machines.

How about demos for the A1200 such as the following, all of which are available for the Falcon:

1) A real-time flight through a texture-mapped landscape i.e you use the mouse to control speed and direction through the landscape

2) A flight through a Mandelbrot set (128 iterations), at 25 frames/sec (I think this may be in realtime, since the docs say the DSP is used 100 %, but this seems too incredible to me)

3) A demo which rotates, twists and scales a Truecolour picture at 50 frames per second

All of the above are also playing 16-bit 50khz sound at the same time.

If these kind of things are possible on the A1200, then fine, but until I've seen/heard of them I'll be inclined to ignore overall system performance based on the much argued about specs of the two machines.

Paul Donovan
cstadbs@csv.warwick.ac.uk

Wouh.This means that for approximately ($200 for cheap monitor, $100
for some more ram and $200 for a small HD) $1800 one gets a computer
equipped with slow 030 with crippled bus andf no support. For similar
price one can get for example a full blown A3000 or for example a
486@33 clone with 8 megs of ram, 250 MB HD, local bus, accelerated
SVGA etc.

The problem is that w/o optimization you will only have something like
10-15% improvement in speed (with applications not benchamrks - this
was tested by Byte a few years back.)

Actually, Paul, these kind of things have been done on the A1000
for almost 10 years. Perhaps the DSP does lend some new pos-
sibilities, but nothing you wrote about is either new or earth-
shattering to the Amiga world.

Yeah, I know, but people were trying to use the 3000 as
a reference, so I just gave the info for it. Nevertheless,
they are all 32-bits (3000, 1200, 4000), with the 1200 and
4000 accessing Chip RAM at twice the 3000's clock speed and
getting 64-bit fetches (I'm pretty sure about this, but it's
been a while since I've read the technical specs).

Can any Amiga play back 50khz samples? :) I mean, Jay Miner is a genius, and he's "da man", but I don't think the A1000 was doing what the Falcon and A1200 are doing today.

(things have changed in the past 10 years)

No, but you're wrong. 1megx4 means that one needs 4 chips to get a megabyte. D'oh.

Yeah, it was kind of a cheap shot -- I didn't think anyone would take it
seriously. Teach me to think in a .advocacy group! I must say I'm
mystified over your seeming horror towards the IBM/Apple/Motorola
consortium. Sure they used the base arch. from the RIOS series chips,
but additional instructions and addressing modes were designed, and the
bus interface has 88110 written all over it. Besides, IBM developed the
RIOS series of chips in a state-of-the-art research facility with the help
of several PhDs, engineers, and millions of dollars worth of computrons.
A lot of these people are pioneers in that area of RISC design. All C=
seems to have is poor overworked Doug Haynie and his two VAXen. [Nothing
against Doug Haynie -- I'm sure he's doing better than could be expected
working with C='s R&D budget...]

: |> : ..The 16-bit colour will probably turn into 24-bit.

You are going to knock yourself on the head and say "D'oh!" when you hear what I have to say. "1 meg x 4" means "1 meg times 4 bits", or "4 megabits". One megabyte is eight megabits, so you need TWO "1megx4" chips to get one megabyte. Therefore, the previous poster was right, and you are wrong.

>megabyte. D'oh.

Ooh goody! A moron to toast!
IDIOT! 1meg*4 means you have a rectangle of bits 1048576 long and 4
wide. 1 megabyte is 1048576 long and 8 wide. Now, children. How many of the
first do we need to make the second?
(pauses to allow the intellectually-challenged of the net to work it out)
Thats right! 2 of them!

4 chips will get you a 16 bit word, which is what a 68000 wants, but you'll
end up with 2 megabytes of memory from that.

John West

:
: No, but you're wrong. 1megx4 means that one needs 4 chips to get a
: megabyte. D'oh.
:

Sorry, Joseph, you're wrong. It's just as I said -- a 1megx4 device contains
1,048,576 storage units of 4 bits each. You need two of these chips to
implement 1 Megabyte. Please refrain from saying things like "D'oh" until
you get informed. Thanks.

>No...the 68882 is fully compatible to the 68881 (and it has the same
>instruction-set). Most instructions will run at double-speed WITHOUT using the
>68882's capability of parallel-processing.

Sorry, that's incorrect. The 68882 and 68881 compute at the same speed
(with the same clock frequency). Motorola claims a speed advantage of 50% for
the 68882 because of its 'parallel' processing for average programs and up to
100% for optimized programs. This is because the 68882 can overlap data
transfer and instruction _decoding_ with the actual computation while the 68881
cannot.

>Oh i've forgotten the SCSI II interface (worth $150)...

How fast is the Falcon SCSI-2 interface ? Do you really believe that _this_
is worth $150 ?

So does the Atari 8 bit. A 3k or so program called Screens allows you to
place windows of any resolution anywhere on the screen. It will automatically
resize stuff cut from one window and pasted to another, even if the dims are
diff. Much better than DLI's & VBI's. And all of this on a machine that
is 14+ years old. Almost makes an ST/TT/Falcon Amiga user want to shoot them-
self.

Yes, definitely. I would say that at 10 MB/sec, which is 5x faster than IDE
it would be a big plus, especially when dealing large chunks of data, such
as sampled sound or graphics.

That's a foolish statement--while the PROTOCOL itself allows for up to
10MB/s using either fast or wide, or 20MB/sec using both fast and wide,
it is very unlikely that this is a stated limitation of the controller,
which is often not capable of keeping up with transfers at that rate.

Nonono. He's stating that it's unlikely (but not impossible) that the Falcon
SCSI interface is speced that high. Now it's up to YOU to prove that it IS.
Quite good, actually... I'd give that an 8.

# 538. Re: Atari Jaguar news(???)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-06-05 01:24:11 UTC
From: legrand@chem.psu.edu
Message-ID: <C84JwB.ELx@cs.psu.edu>
Source record: 22824

"...founder of the video game industry and (professional ball dropper) the creative force behind some of the world's best-known titles (You mean Atarigames , not Atari Computers, right?), has announced the (destined to be delayed a year or so) launch of a revolutionary new (way to raise hopes and ultimately heartlessly dash them) multi-media entertainment system, the Atari Jaguar. The launch will be (real soon now, honest!) supported by aggressive advertising (two ads on some coffee cans and an informercial), promotion (buy an Atari Jaguar, and send for a FREE MANUAL!) and marketing efforts (Sam Tramiel at the Winter CES screaming "Buy a Jaguar! Or I'll KILL YA!") be centered in the New York market in the fall (5 prostitutes on Times Square wearing nothing but a Jaguar and its peripherals), with a national roll-out of the product within one year. (tentatively codenamed: Operation Desert the Lynx Storm)

"The Atari Jaguar, housed in a futuristic casing (Old 520ST cases spraypainted black), is an (out of date before its release) interactive (you play it, it breaks) multi-media (works on ANY TV) system based on (the assumption that Atari owners will believe anything they hear) an Atari-designed (Uh Oh! Looks like Leonard got his hands on SPICE again!) proprietary 64-bit RISC(Y BUSINESS) processor. The 64-bit system is four times (16 bits) the technology currently seen in (reruns of Whiz Kids) the market today (tomorrow, or EVER! - S. Tramiel). The Atari Jaguar features over 16 million (design errors) colors in 24-bit true-color graphics (on the case) and produces shaded 3-D polygons (3-D polygons? No such thing... Kind of like Atari marketing) to be manipulated in a "real" world (Sam's World! Sam's World! Atari Time! EXCELLENT!) in real time. The Atari Jaguar also has (no chance) real-time texture mapping and creates spectacular video effects (when you run a coin across its exposed contacts).

"The sound system is based on Atari's proprietary (We could tell you more but then we'd have to kill you), high-speed (compared to a TRS-80), Digital Signal Processor dedicated to audio. The audio is 16-bit stereo (broken) CD (player in a swimming pool full of Wesson oil) quality and processes simultaneous sources of audio data (such as the owners ranting and raving over the absence of software), allowing for very realistic sounds, as well as human voices (Free Sam Tramiel sample "Atari, no mistakes no apologies" included for additional charge), which are essential for future multi-media applications (such as the most creative use of a no software video game).

"The Atari Jaguar is truly expandable (if you put it into an oven and broil it) and will include a 32-bit expansion port (which will never be used just like on the 7800) which allows for future connection into cable (Like anyone in cable will care) and telephone networks (Oh boy, phone phreaking), as well as a digital signal processing port for modem use (which will require

the vastly superior Ataritech modem, schedule for April 1st 2000 release) and connection to digital audio peripherals such as DAT players. The unit will also have a compact disc peripheral, which will be double-speed and will play regular CD audio, CD + G (Karaoke) (Sing along with Sam! Doin' the no warez Polka!) and Kodak's new Photo-CD(R).

"Currently, there are multiple software titles in development, which will be available on MegaCart(TM). Atari, known for (never releasing) such groundbreaking 3-D titles as BATTLEZONE 2000 and TEMPEST 2000 will issue (but never complete or release) spectacular new versions for the Atari Jaguar. New 3-D game titles will include CYBERMORPH, ALIEN VS. PREDATOR, JAGUAR FORMULA ONE RACING, and many more (Contest to determine which one gets completed and marketed to be held next year). Atari will license third-party publishers to (go broke and drink themselves to an early grave) join the Jaguar family (Honey, I bankrupted the kids!).

"The Atari Jaguar system will revolutionize the (selection of carts at big lots) state of home entertainment as we see it today," said Sam Tramiel (who then went on to explain the connection between Elvis, the Men in Black, and Christina Applegate's bust), president of Atari. "The idea of (Atari releasing and supporting) a 64-bit system is earth shattering (so therefore we'll just lead you on and on and on...) and kids and adults will be amazed at (the $h!+ I'll spew to explain why it hasn't been released as the months go on) both the imagery (That Korean factory was flooded with grape Jello just as the first batch was completed, honest!) and manipulative capabilities (My wife Morgan Fairchild, who I have seen naked, actually SAW aliens steal the second batch, yeah that's it). And we are proud that (we can still string you along after all these years) our entry into the multi-media entertainment category will be fully made in America (except for chips, wires, components and casing but hey it worked for Sam Walton so go for it)." The Atari Jaguar will retail for approximately $200 (give or take $300) and (one) will be available nationwide next year. The Atari Jaguar packaged unit will include one software experience (TIC TAC TOE 2000) and a Power (Supply and a) Pad (to beat your head against when you keep asking yourself why oh why did you believe them this time?) (R) Controller with a ten-key pad and other special features (secret key sequence brings up image of Sam Tramiel laughing at you)."

>
> *Boink!*

Wrong. You really should read up on Amiga specs before making statements
that others might believe. EVERY Amiga owner knows that putting 16-bit
memory in a 1200 slows it down to just above a base 500 or 600 model.
I have 4 megs of 32 bit RAM on my 030-equipped 500, and I cringe when I
feel it dip down into it's 16-bit RAM. It's very noticeable.

>
> The only difference is that C= has provided on board connector for 32-bit RAM

I'd consider that quite an advantage.

The Atari Falcon can do it (ever heard of TT FastRAM? :) ), and
> the OS will support it.
>
> (there are already expansions to take it up to 128MB of RAM from GESoft...)

Amigas have had 128 MB boards for quite a while now.
>
>
> >: And believe me, any problem can be fixed with enough money. The whole

So you're admitting the Falcon has problems?

> Centris 610s with (non-FPU) 68040s in them.
>
What do you consider decently-equipped? I can do alot with only 4 megs
of 32 bit RAM on my 500. It doesn't cost that much to push a 1200 beyond
that, plus you get the new graphics as well.

Gee, if I didn't know any better, I'd say that was a touch sarcastic.
(all the sarcasm, twice the bandwidth of the leading brand! :-)

Atari will reign supreme!!! :-)

But when are they coming out with a RISC/unix workstation?

Well, all I can say is that my 1040ST is still running strong, and
will beat the pants off of many of the IBMs in my dorm (<-- yeah, I'm a
college student... so sue me). Let's face it, the ST was about 4 years
ahead of its time (or IBM was that far behind). Of course, IBM has
caught up, and Atari (I think) has lagged too far back for too long to
really make it up.. at least in the US market. Too bad, IMHO :-(

Banter, banter.......

I believe (Without checking) the A1200 consists of high-density 16bit wide DIPS. Each chip has 16 data lines. BUT they must come in pairs which makes it REAL 32bit ACCESS! The original design was to have 1Mb of Chip. A little slot in board would provide the extra 1Mb. (poss. with clock) Also, there is space (and markings) for the clock.... Why isn`t it installed? I would assume the two banks are selected by a high order address bit. (i.e. the first bank is accessed for the first 1Mb and the next bank for the last 1Mb)

GET IT STRAIGHT!!!! 32bit ACCESS!!!! Unlike falcon and 386SX.

Justin.

I guess the big question is if the Falcon can actually manage that transfer rate...
but hey! if it's even 3.8 megs/sec I'll love that too, I admit.

The solution to case #1 is that one can use various other things to achieve that throughput. 10MB/s could be achieved through SCSI-II networking, large SCSI-II ramdisks, etc; however, I don't believe there's a protocol chip available that's capable of it at the max transfer speed.

Not much lost, considering how unrealistic it is to expect to achieve those theoretical limits.

FPU for something a bit more tempting:

We get $199 'in credit so by spending $521 (Falcon - A1200 system difference)
we get a 68030 @ 40Mhz (at least) with FPU and at least 1 meg RAM.

Now, I admit that a clone is still very tempting for the average Joe

Here are the Amiga 4000 prices(the lowest I have seen them))

The A4000/030-4 megs, 120 meg HD $1499-1599.00
The A4000/040-6 megs, 120 meg HD $1999 delivered from Computerability.

What are the street prices for the Falcon?

Sure.
ECS/AGA amigas can play back 4 channels at 56kHz with 4 dma channels.
Up to 1MHz samples can be played back using the copper, or cpu.

ECS/AGA Amigas, eh?

Now, I've been absent from *.advocacy, so maybe I missed something (the price I pay for playing basketball between reading news :) ) but I remember asking someone a while ago if the limitation on the Paula chip of playing back a max. frequency of 14khz was ever removed. I got a NO.

And in the words of many Amiga owners who wrote on and on and on about .MOD players needing "no CPU time" on the Amiga...

Well... the Falcon could play back using no CPU time.

naaah nah nah naaah naah. <--- typical tone of a post to this news group. :)

Technically, only if you're bypassing the DSP. If you're spending your
time mixing channels with the DSP, you start eating.

Greg, you've got to be a bit clearer in your post. Do you mean that the
Falcon can't have the DSP playing back 50khz sampled sound with no CPU time?
Or do you mean that multiple tracks can't be done with only the DSP w/ no
CPU time?

Anyways, the gist of my post is that the Amiga can't do this with as small an
overhead as a Falcon. That's *IF* the Amiga (any of 'em) can indeed play
back 50khz 16-bit sampled sound in stereo.

(which according to the other post required the CPU and/or the Copper to help
out....)

If you're just playing back a big sample, there's no point in bothering with the DSP--you just send it straight from the DMA system to the CODECs.

: Or do you mean that multiple tracks can't be done with only the DSP w/ no
: CPU time?

See, that's the thing. When you get to this point, you've really got to think. If you ever want to use more than two channels (left and right), you've got to start compositing the audio channels into the two physical ones. To do that takes the DSP, and that means you'll be using CPU time to "help it out". If treated as a "tracker" would, you've got to control start and stops of four or more samples; you've got to composite the samples; you've got to deal with altering samples to change the pitches and playback speeds. On the Amiga, that's all done by the hardware, you nail a few registers and it does the work of compositing itself, and the Amiga's system isn't limited to specific playback rates so you don't have to scale or pitch 'em. And the combining of the four samples happens in hardware. Then, of course, you might want volume changes on that Falcon, which is something free on the Amiga, but would need the DSP on the Falcon.

: Anyways, the gist of my post is that the Amiga can't do this with as small an
: overhead as a Falcon. That's *IF* the Amiga (any of 'em) can indeed play

Correct, the Amiga would take an infinite amount of time to play that sample without extra hardware.

: (which according to the other post required the CPU and/or the Copper to help
: out....)

Nah; that's still pushing. You'll never get 16 bits out of Paula. 12, perhaps, but not 16. Then again, yours will never be quite as cheap as the Amiga's audio system. (cheap, as in, "resources")

> ... That Korean factory was flooded with grape Jello just ...
> ... SAW aliens steal ...
> ... give or take $300 ... ]

What is this ?
Why do I have to find it while reading news ?
Why did you even bother writing it ?

If I had found the puns vaguely interesting, it wouldn't of mattered.
If I had grinned at the little addendums (y business, etc) I would have
been unaffected.
If I had failed to notice the BLATENT lashing out of a compromised mind into
the net, and turned my head from the ravings of some unexplained HATE for all
that is atari, and if I had shut my eyes to what must be the most ANNOYING
article I have EVER read, then you wouldn't be reading this.

But I did, I didn't, I didn't, and I'm PISSED.

I realise this is a `joke' article. But it's not funny. For example, here's
a small collection of amiga jokes (I assume the writer owns an amiga. I was
surpised not to see some homage to the said computer scrawled below):

Q: Why did the amiga owner cross the road ?
A: He thought it would spite atari owners.

Q: What's the difference between an amiga and a piece of wood ?
A: Nothing, except that the wood is better at holding open doors.

Q: Why did the writer post nonsensical drivelings to an advocacy group ?
A: Because that's what he thinks they are for.

Laughing ?

I don't care, and I presume that the writer mentioned above didn't either.

Dave.

PS: Whats wrong with 3D polygons ?
Prositutes ? Aliens ? F**k off

Why would the CPU need to help out the DSP? I would guess that the DSP is
fully capable of handling this once it is programmed to handle such a case.
So once it gets its program from the 68030, the DSP could go off and run and
free the CPU up to do other stuff...

As for specific playback rates being a problem... at least as far as pro-gear
is going, the Falcon can be sync'ed to external sources to do any given
playback rate.

Also, if I remember correctly, even the STe does 3 channels of sound w/ DMA.
So the Falcon has several possible "sound engines" available simultaneously.
Might not be able to beat that for diversity's sake. :)

: free the CPU up to do other stuff...

Remember, the DSP isn't capable of controlling its own DMA. If you were feeding it a constant stream, that would be one thing. But, with composed music, those variables change; pitch is different for each sample, as is the length of time you wish to play that sample. The former requires you to alter the sample on the fly, the latter means you've got to keep track of what's going on.

And the fact that the DSP has a very, very limited address space isn't going to help you any.

: As for specific playback rates being a problem... at least as far as pro-gear
: is going, the Falcon can be sync'ed to external sources to do any given
: playback rate.

That won't help you much when you can't use it. If you understand the concept of the pitch change, you can just play the sample back at a different rate. With the Falcon, you're locked into hardware playback rates, and must alter the sample to get the same effect that a variable playback rate would give you (well, at lowest quality--you could, if you had time, do much more advanced pitch interpolations with the DSP, but that's unlikely--recalculating the baseline would take a while)

: Also, if I remember correctly, even the STe does 3 channels of sound w/ DMA.

At those limited hardware rates, as well as being limited in quality, even compared to the Amiga's capabilities.

Greg

Excuse me, we're not talking about tracker-type music. And saying "composed"
is a misnomer.... all music is "composed". :)

What we were discussing was playing back 50khz 16-bit samples using the
sound hardware (the 16-bit CODECs, possible assisted by the DSP rather than
the CPU to free up more CPU time).

>And the fact that the DSP has a very, very limited address space isn't

>

The change in pitch can be effected in s/w easily. The output should still
be the full 44.1khz even in a tracker sample. Here's a case where you
might want to use what music pros call sample interpolation, where you don't
just speed up or slow down the sample to do a pitch change, but also try

to avoid the "rezzing" of a sample as you reduce the playback speed, or
get a chipmunk effect when you play back higher pitches (time stretching).

Quality is the catchword.

>: Also, if I remember correctly, even the STe does 3 channels of sound w/ DMA.
>
>At those limited hardware rates, as well as being limited in quality,
>even compared to the Amiga's capabilities.
>

Limited in quality?

The "lowly" STe sound chip plays back at up to 50khz.
The Amiga stops cold at 28khz.

Sample a CD. The Amiga will lose every frequency above 14khz. That's about
6000hz of dynamic range gone. Even on 8-bit samples this is noticeable.

If you plan to sway anyone with this "limited hardware rate" argument, you
probably should avoid the issue of QUALITY if you wanna make a point.

(we've argued the tracker thing to death before, but there's no way you
can convince me a 28khz 8-bit sample is superior in any way to either
a 50khz 8-bit sample or a 50khz 16-bit sample... you can argue abotu
system resources all you want, but quality is the catchword... and if the
Amiga's hardware can't do it, that's just another failure of the machine)

That's right. I've mentioned this a few weeks ago, but the Amiga-freaks don't like the truth...
Amigas can't play Digisounds without loosing CPU-time, because the PAULA-chip must be used ;-) (ok...this was a joke...no flames please)

>Also, if I remember correctly, even the STe does 3 channels of sound w/ DMA.
>So the Falcon has several possible "sound engines" available simultaneously.
>Might not be able to beat that for diversity's sake. :)

STE-DMA-Sound has 4 channels. But it has the same problem as the Falcon soundsubsystem: it can only play fixed frequencies (on the other hand you can alter treble and bass without CPU-time).

Ciao, Heiko.

I have seen DSP-Protrackers which use less than 1% of CPU-time. So what are
you talking about? Even PAULA needs a little CPU-time on the Amiga...

>That won't help you much when you can't use it. If you understand the

If 50Khz-Mods running on the 68030 only use 32% of CPU-time, the same routine
on the DSP will be very fast. The DSP 56001 has more than 20 MIPS and you are
dare enough to say 'recalculating the baseline would take a while'.
Fact is, that Protrackers on the STE have the same sound quality than
Protrackers on the Amiga. You can't hear any difference at 25 KHz (and i've
heard a lot of modules on an Amiga...)

>At those limited hardware rates, as well as being limited in quality,
>even compared to the Amiga's capabilities.

Aehem... where are the facts, Greg?

Ciao, Heiko.

Sure, but there was plenty of info on the Jaguar in comp.sys.atari.st, which is where you should look for atari related issues (eg: the Jaguar). I don't object at all to sarcasm. In fact, that's the main reason I read this group. I do object to drivvle. As far as I was concerned, that post could have been a legit announcement, interspaced with bracketed nonsense (dvwdvrgfgdcvbawerg fdsfdfsd). It annoyed me.

So get it straight yourself. The Falcon's 68030 does Syncronous bus accesses while the A1200's 68020 does Asyncronous accesses. Add better caching, and internal MMU, and the burst mode capabilities and a 68030 connected to a 16 bit bus will beat a 68020, connected to a 32 bit bus, running up to a 15% faster clock rate.

So get a life, the markets are not the same.

Brian

Brian, Brian, Brian...
Tell me how many clock cycles does it take to fetch something
from Falcon's ram? The minimum is 2 with syncronous bus cycles on 030,
but as you would then have to got 60 ns ram (or something like that).
And that would only be enough if there were no display DMA (etc.)
using the same bus.
68030 does have that 256 byte data cache 020 does not have.
Next question: how much do you think that would help in a 0 wait state
system like A1200 w/ fast ram (I don't think that the fastram boards
for A1200 need any wait states but use a 3 clock cycle asyncronous bus
cycle)? It does probably help a bit in Falcon if it is used which I
doubt a bit. It is pobbile though.

> internal MMU, and the burst mode capabilities and a 68030 connected to a 16

Are you on drugs or something? MMU does not speed things up. Rather
the opposite. In some special applications (emplant) it does indeed
speed some things, but in general it definately is no help speedwise.
And Falcon does not use burst mode. 68030 is not able to use
it over a 16 bit bus. (I think that to be able to use syncronous
cycles you would also need 32 bit bus. I shall check that next time I
read my 680x0-book.)

> bit bus will beat a 68020, connected to a 32 bit bus, running up to a 15%
> faster clock rate.

13%. Less than 13%.
68020 with a 32 bit bus with 3 clock cycle bus cycles beats
68030 with 13% faster clock and at least 3 clock cycle bus cycles and
16 bit bus. Easily. Very easily.

> So get a life, the markets are not the same.

He will get a life if you will get your facts right, Brian.

Well, as a stockhlder I got some new trash you may care about (info):

1) stock has almost tripled to 2.50. Still pretty sad, but a nice nmo□
□move. Atari is going to do a 10 to 1 "anti" split, so the stock
should
go to about $20 (hopefully), but the # of shares will be cut in 10.

Anyhow, Atari is making a 64 bit RISC game machine. 16 bit sound at
50kHz (yes, better than CD). 24 bit color. Real time polygon rendering
(not what NES will try to sell you with starfox). Of course, I count on
Atari to fuck it up, but it would be a real nice machine for simulation
type games.

I guess thats it. Is ATARI going to go to the power-pc chip like
Apple?

Jeez. Ease off captain.

I can see how better caching will provide a speed increase, but an
"internal MMU" ? How does an MMU provide a speed increase ?

Synchronous vs. Asynchronus ? I don't see how locking memory accesses
at a fixed rate provides a speed increase, unless you are using slower
RAM on the '020. In fact, it would seem that getting faster RAM on a
synchronous bus would provide no speed increase at all, since the
memory accesses are provided at a static rate.

And lastly, we all know that a quicker clock rate means faster
instruction decoding/execution speed, but it says nothing of memory
accesses, which will be, interestingly enough, twice as fast on 32-bit
word fetches (and stores).

I think some numbers would be helpful in gauging a REAL comparison of
these machines....MIPS/Mflops, benchmarks.....

Anyone ?

WRONG! You don't know how much slowdown you get for cripling a '030
to a 16-bit data bus. And another thing: THE FALCON DOES NOT SUPPORT
BURST MODE (standard Falcon config). Why? Has to do with that 16-bit
data path... (one of the reasons, there could be more)

Just for facts, 3D polygons are polygons with coplanar 3 dimensional vertices.

For example, the surface of a cube in a given orientation is defined
by 6 3D polygons.

: bit bus will beat a 68020, connected to a 32 bit bus, running up to a 15%
: faster clock rate.

If you're going to boast about your architecture, at least do it
CORRECTLY.

1) The internal MMU is faster than the external, yes. However,
currently, the AmigaOS doesn't _USE_ it. So it's really a moot point.

2) Better caching? Larger cache size, but due to the nature of the chip
ram on the Amiga and the ST/motherboard ram on the Falcon, neither can do
data caching, instruction only.

3) Burst? The Falcon's 030 can't _DO_ burst--due once again to the
memory architecture, for the same reason that Amigas with 030's
can't--it's a shared memory bus, one which the custom chips get
deterministic access to. In order to do burst, you have to be able to
hit memory with consecutive cycles, often on the order of 5/2/2/2 on 030
Amigas.

The fact you can't use burst or data cache will knock down the
effectiveness of an 030 over an 020. Without burst, an 030's uses are
limited in comparison to an 020.

I advise you read up a bit before you post replies.

In article <1vgq0u$itr@cville-srv.wam.umd.edu>, Dragon's Claws (cmedley@wam.umd.edu) wrote:
: Excuse me, we're not talking about tracker-type music. And saying "composed"
: is a misnomer.... all music is "composed". :)

Electronic music is either "composed", made up of small samples that are played back in different ways to create different pitch levels at different times, or it is "digitized", where a whole sample is played back as-is.

: What we were discussing was playing back 50khz 16-bit samples using the
: sound hardware (the 16-bit CODECs, possible assisted by the DSP rather than
: the CPU to free up more CPU time).

"Digitized". And why would you need the DSP? The DSP can't feed the CODECs, because it can't access system ram, it has no understanding of memory outside of its own, private pool.

If it's digitized, you should (I imagine) be able to set your DMA system to the beginning of the sample, and stream your data straight through to your CODECs.

However, as anyone could tell you, that's a sorry excuse for composed music, especially when composed music is all you need.

: The change in pitch can be effected in s/w easily. The output should still
: be the full 44.1khz even in a tracker sample. Here's a case where you
: might want to use what music pros call sample interpolation, where you don't
: just speed up or slow down the sample to do a pitch change, but also try
: to avoid the "rezzing" of a sample as you reduce the playback speed, or
: get a chipmunk effect when you play back higher pitches (time stretching).

: Quality is the catchword.

Expense is the catchword; that's what I was talking about towards the end of my diatribe; and if you remember correctly, I said it was expensive to do--and it IS. Not something you want to do on several samples. Yes, the output should still be the full 44.1khz, but you'll spend all of your time doing it.

: Limited in quality?

: The "lowly" STe sound chip plays back at up to 50khz.
: The Amiga stops cold at 28khz.

The "lowly" Amiga has a full 8 bits of data with 6 bits of volume control, giving you an effective 12 bits of data width. This gives you a

LOT more accuracy, because quiet sounds can be represented with the
change of volume, without increasing the amount of error in your sample.

Additionally, the Amiga's chipset allows you to use channels to modulate
other channels.

: If you plan to sway anyone with this "limited hardware rate" argument, you
: probably should avoid the issue of QUALITY if you wanna make a point.

I'm not arguing that 50khz isn't as good as 28, that's dumb. I'm not
arguing 8 bits over 16, it's dumb.

I'm saying it costs far too much.

: system resources all you want, but quality is the catchword... and if the

Quality won't get you anywhere with me unless I get speed with it. And
on the Falcon, the more you take from the CPU, the more you feel it.

In fact the MMU doesen't provide a speed increase. The internal MMU has other advantages, like memory protection and is very helpful when using virtual RAM. I have tested the speed increase provided by the Falcons caches: Quick Index indicates that the cache double speeds memory fetching and register access.

>And lastly, we all know that a quicker clock rate means faster
>instruction decoding/execution speed, but it says nothing of memory
>accesses, which will be, interestingly enough, twice as fast on 32-bit
>word fetches (and stores).

The 68030 in the Falcon surely also has a 32bit adress bus (it would be very expensiv to use a 68030 without 32bit adress bus.). So it's no problem to expand the Falcon with Fast-RAM. It's also a fact that Blitter, DMA and the Video shifter can only adress 24bit and this is the so-called ST-RAM.
I would like to know the adressing range of the Amiga-Blitter, can anyone tell me?

>I think some numbers would be helpful in gauging a REAL comparison of
>these machines....MIPS/Mflops, benchmarks.....
>
>Anyone ?

According to the Falcon manual (see Appendix A) the Falcon 030 has 3.65 MIPS.

In my last post i have said that the DSP in the Falcon has 20 MIPS - sorry, my fault, this is wrong: the 40MHz-DSP has 20 MIPS but the 32MHz-DSP in the Falcon "only" has 16 MIPS. But i think this changes nothing: playing Protracker modules is a very little exercise for the DSP 56001...

Ciao, Heiko.

This brings up an interesting thing about AmigaDOS... it may be robust and really nice, but it has NO MEMORY PROTECTION.

So one reason they could go with the 68020 is that the system wouldn't take advantage of some of the added features the '030 has on the '020, like the built-in MMU....

(just to let you know, MiNT/MultiTOS have memory protection, as does UNIX, XENIX, etc... hmmm... am i noticing a trend? don't want one program munching it's way through another program's memory, do we? :) )

Because the DSP can be used to add real-time digital effects to the music
being played back. This can be used to add ambience, and do fun things
with sounds... you know, like echo, reverb, flange, chorus, digital delay,
etc... the nice things musicians wanna do with effect racks.

All of these can be done on a Falcon out the box with software.

Can the Amiga do that?

Nope.

>If it's digitized, you should (I imagine) be able to set your DMA system

True, but that's only if you don't want to process what you're playing
back.

Think like a musician. :)

>However, as anyone could tell you, that's a sorry excuse for composed
>music, especially when composed music is all you need.

hahahahaha... this is a good one. Composed music on WHAT?
The Paula chip?
I've got 2 keyboards, 2 rack mounts, and a drum machine. Each one has
it's own "feel" and abilities. You seem to think that a sound chip isn't
like, say, a guitar, where each one has it's own unique sound. If you've
ever done any patch programming on a keyboard, you'd know what i mean.

The Amiga sound chip is far from adequate for professional uses. And if I
want to compose music, I've got over $3000 worth of gear to do that with.

So don't try to convince me that a 4 voice 8 bit chip is the next Kurzweil
K2000.

But the bottom line is, like I said, you can't play any frequency higher than
14khz.

Even the crummy YM-2149 crap that comes in stock STs can play back > 28khz
samples...

To even compare an 8-bit chip (even with a whopping 6 bits of volume control,
ooooooooh! i really wanna dump my MIDI rig now!) to pro-level gear is
plain lunacy!

>: If you plan to sway anyone with this "limited hardware rate" argument, you

Well, I think that considering the system costs $1500 with 4/80 config, and
it can do this out the box...and even has software shipped with it to do it

makes it cost just right considering every other platform would require add-ons and s/w that would total the cost of a Falcon system just to do it.

The closest in price/performance for this purpose is a PC with a 16-bit sound card.

I sure do know the difference, and if you had spent any time doing performance analysis of 68020 and 68030 systems you would also know that what I said was true. The internal differences in the two processors are rather important, and do give a 68030 a big advantage.

Actually burst mode support is moot since it is used to try and bring the processor up to zero wait state performance, which the FALCON already has. Since you actually bit on this one it shows that you did not think much before posting.

With regards to the internal MMU, I admit that this only helps when performing memory management. The internal MMU adds zero wait states while an external PMMU for the 68020 typically adds 2 wait states. So if you are using any virtual memory the "crippled" 68030 will be even faster than super whiz bang fast-ram (does this mean zero wait states?).

And as I said before: So get a life, the markets are not the same.

>And lastly, we all know that a quicker clock rate means faster
>instruction decoding/execution speed, but it says nothing of memory
>accesses, which will be, interestingly enough, twice as fast on 32-bit
>word fetches (and stores).

The 68030 in the Falcon surely also has a 32bit adress bus (it would be very
expensiv to use a 68030 without 32bit adress bus.). So it's no problem to
expand the Falcon with Fast-RAM. It's also a fact that Blitter, DMA and the
Video shifter can only adress 24bit and this is the so-called ST-RAM.
I would like to know the adressing range of the Amiga-Blitter, can anyone
tell me?

The address bus is not an issue. When the Falcon requests a
memory word (32 bits), it puts the 32 bit address on the address bus,
and then (the important part, speedwise) memory puts its data on the
DATA bus, 16 bits at a time, taking two bus cycles. The only thing
that a larger address bus provides is a huge address space (~4 Gig),
which I am not quite sure, but think is the case with the 1200.

>I think some numbers would be helpful in gauging a REAL comparison of
>these machines....MIPS/Mflops, benchmarks.....
>
>Anyone ?

According to the Falcon manual (see Appendix A) the Falcon 030 has 3.65 MIPS.

In my last post i have said that the DSP in the Falcon has 20 MIPS - sorry,
my fault, this is wrong: the 40MHz-DSP has 20 MIPS but the 32MHz-DSP in the
Falcon "only" has 16 MIPS. But i think this changes nothing: playing Protracker
modules is a very little exercise for the DSP 56001...

Gotta love the DSP.

Ciao, Heiko.

Regards,
Matt

>true. The internal differences in the two processors are rather important, and
>do give a 68030 a big advantage.

There are several internal differences. Minor ones like optimized instructions
and major ones like the full Harvard architecture. The latter allows you
to concurrently fetch data and instructions. Since you only have one external
bus this mostly helps for external data fetches while the program runs from
the cache. The benefit depends on the speed of the external bus. If you
have a slow external bus then you won't see much of 'overlap' as the
instruction unit most often waits for the data fetch to complete. If you
have a fast external bus than the internal instruction fetches would take
a large fraction of the overall instruction time (including the external
data fetch) and so the overlap is important.

The Falcon has a slow external bus.

>Actually burst mode support is moot since it is used to try and bring the
>processor up to zero wait state performance, which the FALCON already has.

Sorry, the burst mode can go faster than 'zero wait state' and I wouldn't
talk about 'zero wait states' when any 32bit access has lots of them
since you are talking to a 16bit memory port.

>With regards to the internal MMU, I admit that this only helps when performing
>memory management. The internal MMU adds zero wait states while an external
>PMMU for the 68020 typically adds 2 wait states. So if you are using any

No. It typically adds one waitstate. This is the case with the A2620 board
(I believe the only 020+PMMU board for any Amiga). The A1200 also would
have some problems to support a MMU for the EC020.

>virtual memory the "crippled" 68030 will be even faster than super whiz bang
>fast-ram (does this mean zero wait states?).

Except for Jerry and you noone argues that virtual memory increases speed.
Besides, what OS do you want to run that offers virtual memory ?

>And as I said before: So get a life, the markets are not the same.

Who cares about markets ?

>really nice, but it has NO MEMORY PROTECTION.

That is true. What is equally true is that since upgrading to Workbench 2.04,
the only crashes I have had have been caused by PD demos and a flaky PD
program or two. Memory protection is no big deal in my opinion.. I will
concede that virtual memory is useful though..

>So one reason they could go with the 68020 is that the system wouldn't

> for why the GameBoy sells.

The Lynx *is* doing reasonably well, in terms of market share; compared to their actual computers. They'll never really be a successful comapny until they start advertising. I don't know why the people at Atari don't understand this. They have very light advertising for their hand-help game machine, and *no* advertising (in the US, at least) for anything else they make. Sure, recognition of the Lynx may help Jaguar sales, if and when the Jag actually comes out. But most people I have talked to never even knew Atari *made* computers. They hear Atari and think of the Lynx (or more likely, of the 2600).

I'm sending follow-ups to *.advocacy, since this whole thread really belongs there.

Anybody read the post over in amiga.advocacy recently about Atari buying
CBM stock and CBM buying Atari stock so that all user complaints got stuck in
an infinite loop? Well here's another similarity: neither company seems to
understand the meaning of advertising... (Or maybe they just can't afford it?
If so, perhaps a joint... Nah! It'd never happen! :)

Robert Brown.

>Nope.

You would do well to educate yourself before making stupid statements like
that. The Amiga can do that, and has done that since 1986 when I first
bought it. The predecessor to the program now known as "Sonix" for the
Amiga had a control panel for the effects you describe.

>The Amiga sound chip is far from adequate for professional uses. And if I

By that argument, the Atari sound hardware is just as far from adequate.
Isn't this discussion about the computers, and not the gear they drive?

>So don't try to convince me that a 4 voice 8 bit chip is the next Kurzweil
>K2000.

'Tis not. But I myself use it to create interesting sound effects that my
own gear can't produce.

: Because the DSP can be used to add real-time digital effects to the music
: being played back. This can be used to add ambience, and do fun things
: with sounds... you know, like echo, reverb, flange, chorus, digital delay,
: etc... the nice things musicians wanna do with effect racks.

Yes, and definitely agreed. Those are only useful, however, when you're using the DSP to channel the data. It means you're still going to be using two channels, and it muscles in on your ability to provide multiple voices and composed playback. Which is fine if you're just playing some digitized stuff. But do much other than audio processing with it, and you're better off with MIDI.

: Think like a musician. :)

Okay. Screw using the internal sound, its a waste of resources--go through MIDI instead, and then take your left and right channels coming out of your MIDI equipment, and pump it through your DSP and out again, getting the effects you want.

: hahahahaha... this is a good one. Composed music on WHAT?
: The Paula chip?
: I've got 2 keyboards, 2 rack mounts, and a drum machine. Each one has
: it's own "feel" and abilities. You seem to think that a sound chip isn't
: like, say, a guitar, where each one has it's own unique sound. If you've
: ever done any patch programming on a keyboard, you'd know what i mean.

I -DO- know what you mean. Now it's time for you to know what _I_ mean. In many cases, going through MIDI is both unnecesary and unwanted. This is true for games. Games can benefit from composed rather than digitized music because you don't want to have to have a huge digitized soundtrack. It's cheaper just to take some digitized instruments and a score, and play that back. But the more channels of audio you use, the less quality you can pull off without taking CPU time away, time which is very, very important during games. And if the CPU wasn't having enough trouble, it can be worsened by having the number of channels of audio each being processed to modify whatever is supposed to be played in any particular way.

That's a lot of stuff to be doing, and a lot of CPU intervention as a result.

: The Amiga sound chip is far from adequate for professional uses. And if I

Fine. Never claimed like it was. Stop thinking like a musician, and
think like an average user.

: So don't try to convince me that a 4 voice 8 bit chip is the next Kurzweil
: K2000.

Don't try to convince yourself of it, you mean.

: You like to say this, but you have no proof as to how much system resources
: would be spent on this process.

I know the capabilities of the 56001, and I understand the process of
what is happening. And knowing how much the 56001 will have to rely upon
the CPU, as well as the taxing nature of the system itself, is enough to
know that it isn't great.

: But the bottom line is, like I said, you can't play any frequency higher than
: 14khz.

Right.

: Even the crummy YM-2149 crap that comes in stock STs can play back > 28khz
: samples...

And crap it is, yes.

: To even compare an 8-bit chip (even with a whopping 6 bits of volume control,
: ooooooooh! i really wanna dump my MIDI rig now!) to pro-level gear is
: plain lunacy!

Who said I was? I hope you're not narrow-minded enough to think that the
DSP isn't going to be used by average users for average tasks, and
something other than a professional musician's tool.

I'm looking at the system from an average user's point of view. You're
looking at it as a professional tool, and that's fine, but that doesn't
make it a good PERSONAL computer.

: Well, I think that considering the system costs $1500 with 4/80 config, and

Cost, as in resource cost. Not as in money.

Greg

It seems to me that since the DSP can be a link in a DMA routing chain that it's not necessary for the actual sample to fit into the DSP RAM. You just need to store the player code/score which is a lot easier to fit in there.

For example, you simply use system calls to connect the DMA sound output directly to the DSP, which modifies the sound as it goes through (according to the specs in the player/score), then connect the DSP output to the CODEC and you're all set. Admittedly, this may not be as flexible for MOD files and whatnot but it seems like the possibilities are a lot greater than you would have us believe.

Plus, if as you said the MOD stuff is used mostly for games then it seems reasonable to fit 20-30K of sample into the DSP RAM and use that for playback of pseudo-music or whatever. Sound effects don't need to fit into the DSP at all since it's usually not necessary to alter them, and for that matter you can probably get away with only digitized sounds for a lot of music blurbs too.

>faster clock rate.

Hmmm... Excuse me.... What was this pointless flame for?????

Someone asked about the A1200 memory configuration. Jerry insinuated that
the A1200`s memory seemed to be 16bit from the type of DRAM used. I`ve seen
the insides and the chips have 16data lines each. They are accessed in pairs
and this gives 32bits! The falcon however does not access 32bits in one single
CPU access. It lives from a 16bit bus.

This gives arises to the following!

i) Slow access to longwords in memory. 16bit access do not suffer, but nor
do they on the A1200.
ii) NO BURST MODE - a very important speed increasing method. The 68030 does
not and can not support burst mode from 16 bit RAM. Don`t give us any crap
but the burst mode still gives a large increase of speed from any type of
32bit RAM, whether it`s zero-wait state or not!
iii) LOTS of contention with video bus. The Amiga may suffer from a similar
problem (but not as severe) but adding a *simple* *cheap* fast RAM board
removes CHIP RAM contention completely.

I don`t completely hate the Falcon but I must stress....

14.3MHz '020 with FAST RAM will be faster than the Falcons 16MHz '030. FACT.

BTW When is the Falcon available? Hmm.... ;-P

I don`t normally get into slanging matches but your childish and immature
approach to a correct and factual response required action!

>So get a life, the markets are not the same.

I`ll get a life when you do.

Your right the markets are not the same. The Falcon is nice sitting in a
recording studio and the Amiga is a very good (And popular) computer.
BTW isn`t the A4000/30 the same price as the Falcon HD?

A4000/30 = *25MHz '030*
85Mb HD
4Mb RAM

Falcon HD = 16Mhz '030
60Mb HD
4Mb RAM

The *ONLY* thing going for the Falcon is its DSP. When the Amiga DSP comes along it is gonna CRUSH the Atari`s feeble effort. FACT.

>Brian

No Brain Brian?

Justin.

Traraaaa!!! Look! There are even wonders happening on the Amiga!
The Falcon effects ar realtime with 50KHz 16bit samples - that will be NEVER
done by a 68000 with 8Mhz! Forget it!

>>The Amiga sound chip is far from adequate for professional uses. And if I

JUST as far? How about this: the Amiga 1200 video hardware is just as far
from adequate for professional uses than the Falcons.
Fact is: you can't hear better samples than those 16bit-50KHz ones (this is
CD-quality!). Another fact is, that the Amiga resolutions are really near
the best photographic quality you can reach on a Monitor.

Ciao, Heiko.

I've seen Sonix. Sonix is not even close to adequate for professional use.
Sonix simply drove the Paula chip and the effects were not comparable to
effects processors of its era...

(unless you count cheap pedals for guitarists back then)

How would Sonix stack up against a DSP effects application, like AFM on the
Falcon with stereo 16-bit out and realtime application of effects to incoming
stereo sound?

Let's be realistic... it wouldn't. :)

Wait a second. You're operating under the concept that the DSP does
one channel of 16-bit sound.

This is not the case... read the Falcon product literature. It is capable
of *8* channels of 16-bit sound.

>
>: Think like a musician. :)
>
>Okay. Screw using the internal sound, its a waste of resources--go

>In many cases, going through MIDI is both unnecesary and unwanted. This
>is true for games. Games can benefit from composed rather than digitized

Who said we were talking about games? If you wanna play games, go get
a Super Nintendo or a Sega Genesis. If you're an Atari cheerleader, you

can wait for Jaguar. :)

In case you forgot, the discussion began with the ludicrous claim that
the Amiga sound chip can handle 50khz sampled sound playback as good
as a Falcon.

I knocked that one out the ballpark.

>
>Fine. Never claimed like it was. Stop thinking like a musician, and
>think like an average user.
>

An average user probably has a Super Nintendo to play games on and a PC
clone to do work on.

:)

>: But the bottom line is, like I said, you can't play any frequency higher than
>: 14khz.
>
>Right.
>
>: Even the crummy YM-2149 crap that comes in stock STs can play back > 28khz
>: samples...
>
>And crap it is, yes.
>

But alas, this is subjective! For, as the gentleman who uses Sonix claims,
there are just things that the YM2149 can do.. sounds it can make, and
a feel to it that is unique! As the composer John Cage would say, "Sound is
music!". Why, to listen to the simplicity of the YM2149 as it plays back
pitches across it's 9 octave range can bring even the most jaded user to
the levels of sonic bliss that previously could only be attained with
expensive drugs!

:)

Back to reality: Yep, the stock ST sound chip was crappy. For games. For
90% of everything. But it still could play back frequencies over 14khz.
Is that important? Not particularly, because the *quality* of the sound
would be inferior to the Amiga sound chip. But isn't that my point about
the Falcon's 16-bit sound system?

>: To even compare an 8-bit chip (even with a whopping 6 bits of volume control,
>: ooooooooh! i really wanna dump my MIDI rig now!) to pro-level gear is
>: plain lunacy!
>
>Who said I was? I hope you're not narrow-minded enough to think that the
>DSP isn't going to be used by average users for average tasks, and
>something other than a professional musician's tool.
>

Who said it was just going to be used for music applications?

One of the nicest uses I've heard of for it is that it was claimed that it could handle 3D rotations of (i believe) 10,0000 vertices in real time. (i may be off by a power of 10)
:)

>I'm looking at the system from an average user's point of view. You're
>looking at it as a professional tool, and that's fine, but that doesn't
>make it a good PERSONAL computer.
>

I'm talking about sound. Did you see me claim the Falcon was a better computer? Nope. The better computer is in the eye of the beholder. If I have both a Falcon and an Amiga, I'd probably get more use out of the Falcon and believe it to be the better machine. If a video guru gets both, I'd bet the Amiga would win to him or her hands down.

Ho hum, you're shouting dear and sounding a little unreasonable.

People, please stop talking about `crippling' CPUs. The EC020 is a crippled 030 due to lack of (amongst other things) an MMU which severely cripples its use for us unix types. The Fs' 030 has a 16 bit wide data bus which cripples that CPU. The A1200 has no SCSI bus which cripples its I/O capabilities and severely limits disc capacity and speed.

And so on.

Since this has gotten to the wonderful stage of name calling let us review the facts of the wonderful Amiga 1200 vs Falcon 030. Let's compare both stock and enhanced bus accesses.

| | Stock | | Enhanced | |
|---|---|---|---|---|
| | Falcon | Amiga | Falcon | Amiga |
| Clock rate (mhz) | 16.0 | 14.0 | 32.0 | 50.0 |
| Clock cycle (ns) | 62.5 | 71.4 | 31.2 | 20.0 |
| 32bit access(ns) | 250.0 | 214.2 | 62.5 | 60.0 |

Note: The "Enhanced" access time represent access time to the FAST ram on the processor board. Any access to the base memory will have the same access time as a "stock machine.

Because trying to wade through the instruction pipeline timing on the 68030 is something similar to getting a useful comparison information out of an advocacy group on internet, it is basically impractical to make a definitive statement about the how the 68030 will behave in a typical situation. So I'll leave the comparison of the internal pipelining, to those that feel that they have mastered it.

So on stock machines, simple bus accesses alone the Amiga is 15% faster than the Falcon, or the Falcon is 17% slower than the Amiga. Now if you add the enhanced processors with 32 bit memory, and yes memory is REALLY 32 bits wide on the Falcon enhanced processor board, the Falcon will be 4% slower at bus access than the Amiga. Showing the supposedly crippled Falcon at 32mhz can keep up with an Amiga running at 50mhz. (Of course all the Amiga biggots out there will now start talking about the importance of the instruction cache.:)

Now add the internal differences between the 68020 and 68030 and the 68030 really does out perform the a 68020 regardless of either of these two configurations.

Brian

BTW: The Falcon comes with an 80mb HD, not 65mb, in the US.

Sure, maybe not on a system where the CPU has to do all the work that a REAL DSP should be doing...but I would imagine that w/ a DSP in an amiga multiprocessor system there would be little or no problem for the computer to do 50KHz samples in 16bit even on a 6502 at 1mhz...it's all up to the DSP.

I don't see this. Your numbers don't reflect what you've just said --
in fact, just the opposite. A longer access time means slower access
and vice cersa, correct ? So it would seem that the stock falcon
narrowly outperforms the 1200, and enhanced, the opposite is true.

Given that the 1200 can be had for under $500 US, I think that maybe a
better comparison would be the falcon and the 4000/030, no ?

>Now add the internal differences between the 68020 and 68030 and the
>68030 really does out perform the a 68020 regardless of either of these
>two configurations.

Perhaps. But the Falcon's 030 is only narrowly outperforming the
1200's 020 (at almost half the clock speed). This seems like quite a
disappiontment to me.

I'm not so sure I like your sig. Does it mean that the Atari's can't
play good games, or do you mean that real work can't be done on an
Amiga ? Either way you are wrong. I challenge you to find one "real
work" application that the Atari platform is equipped to perform that

the Amiga cannot. My Amiga has met every need that has arisen for me, something I cannot say for my once beloved ST.

Matt

: It seems to me that since the DSP can be a link in a DMA routing chain that
: it's not necessary for the actual sample to fit into the DSP RAM. You just
: need to store the player code/score which is a lot easier to fit in there.

Except that the 56001 can't access ANYTHING outside of its small pool of ram. Which means it isn't capable of playing the various samples in a composed score without having them in that local ram. Otherwise, its got to get the CPU to re-feed the sample over again.

: For example, you simply use system calls to connect the DMA sound output
: directly to the DSP, which modifies the sound as it goes through (according
: to the specs in the player/score), then connect the DSP output to the CODEC
: and you're all set. Admittedly, this may not be as flexible for MOD files
: and whatnot but it seems like the possibilities are a lot greater than you
: would have us believe.

For composed music, its very limiting. It means that you've either got to fit EVERYTHING into the small ram area, or you've got to do everything with the CPU, using the DSP as a mixer.

: Plus, if as you said the MOD stuff is used mostly for games then it seems
: reasonable to fit 20-30K of sample into the DSP RAM and use that for
: playback of pseudo-music or whatever. Sound effects don't need to fit into

A _SINGLE_ one? Mods, at their currently low sampling rates, rate at about the 90k mark; That's with four channels. Go 16-bit, and it could be a lot more.

: the DSP at all since it's usually not necessary to alter them, and for that
: matter you can probably get away with only digitized sounds for a lot of
: music blurbs too.

But if the goal is to keep the CPU as free as possible for the game itself, you inevitably fail on anything of noteworthy size.

: No room for sloppy coding! This is not a disadvantage.

Who said ANYTHING about sloppy coding? I doubt you'd fit all of the
SAMPLES into the local ram alotted. Most MODs are about 90k, sample and
score. Add the player. That's for four channel, low to mid-quality
samples. Add more channels, and your player code gets larger. Add wide
(16-bit) or better samples, and your samples grow exponentially.

Sloppy coding? Yeah, right. I don't even think you'd have room for the
CODE.

The smaller number under "32-bit access" means that's how long it takes
to do a full 32-bit access; without verifying the table, I wouldn't
venture to say if it's true or not, but that would mean that the Amiga,
because it can access a 32-bit word in less time than a Falcon, is a
faster machine.

In article <1vpud7$3h0@cville-srv.wam.umd.edu>, Dragon's Claws (cmedley@wam.umd.edu) wrote:
: Wait a second. You're operating under the concept that the DSP does
: one channel of 16-bit sound.

Actually, there are TWO physical channels, not one. One left, one right.

: This is not the case... read the Falcon product literature. It is capable
: of *8* channels of 16-bit sound.

It is CAPABLE of that, silly, because the DSP does the work to MAKE it do that.

: Yep, that's the plan.

And it's not a good solution; MIDI is fine for some things, but not for everything. Often MIDI is overkill. Sometimes, MIDI is incapable of doing what a competent audio system could. The Falcon's audio system isn't incompetent, its just expensive to use.

: Who said we were talking about games? If you wanna play games, go get
: a Super Nintendo or a Sega Genesis. If you're an Atari cheerleader, you
: can wait for Jaguar. :)

In case you weren't sure, I did say the word "example". If you're incapable of thinking of a different one, that's fine, but there are more than a few situations where you wouldn't need or want to do things over MIDI.

: In case you forgot, the discussion began with the ludicrous claim that
: the Amiga sound chip can handle 50khz sampled sound playback as good
: as a Falcon.

No, it did NOT; because it cannot. Everyone knows that. My claims were very specific, aimed at the expense and inadequacy inherent in the Falcon's audio system.

: I knocked that one out the ballpark.

Unfortunately, you were playing football.

: An average user probably has a Super Nintendo to play games on and a PC
: clone to do work on.

An average user doesn't necessarily have 1200 bucks in audio riggings.

: But alas, this is subjective! For, as the gentleman who uses Sonix claims,

No, it's not. The STe's audio is technically inferior, that's been hashed before. Technically, the Falcon's is much, much better than Paula's output, and I'm not arguing that. I'm arguing that it's too expensive in resources.

: Is that important? Not particularly, because the *quality* of the sound
: would be inferior to the Amiga sound chip. But isn't that my point about
: the Falcon's 16-bit sound system?

At what cost, again.

: Who said it was just going to be used for music applications?

That depends. Would you LIKE to use your audio while using it for something else? The Falcon doesn't allow that.

: One of the nicest uses I've heard of for it is that it was claimed that it
: could handle 3D rotations of (i believe) 10,0000 vertices in real time.
: (i may be off by a power of 10)
: :)

Who knows, its possible. Then again, while you're doing that, you're either going to be playing back digitized audio samples, or you're going to be using the STe chip.

: I'm talking about sound. Did you see me claim the Falcon was a better
: computer? Nope. The better computer is in the eye of the beholder. If

When taken as a professional audio studio, the Falcon does well. But because of the EXPENSE of its audio system, the audio system becomes much less useable.

No, they don't. To date, there is no universal, and elegant way to
calculate a MIPS rating on any platform. It is far too easy to misinterpret
the results, and even design such a test so that results are more than
a little misleading. Another problem with using MIPS is that one processor
may score a higher MIPS rating than another, but if the latter is actually
doing more work per instruction you will not see the net effect in the
simple MIPS numbers. Hence the reason MIPS has developed the alternate
acronym "Meaningless Indicator of Processing Speed".

Sloppy coding has little to do with it. In some situation, no matter
how good you may think you can whip up something, there simply will not
be enough room for it.

>faster machine.

Indeed. Simply forgetting about the 'enhanced' part of the table up
there one must take into account several things left out of this
comparison. For starters, both the 68030 and 68020 always do 32-bit longword
instruction prefetches and cache fills. Specific data accesses are the
only time these processors will hit memory with an access width less than
32 bits.
Second of all, the above table is not correct to begin with. A
more properly set up table would look like this:

Stock "Enhanced"
Falcon Amiga 1200 Falcon Amiga 1200
Clock Speed (MHz) 16.0 14.28 32.00 50.0
Clock Cycle (ns) 62.5 70.03 31.25 20.0
16 bit or 8 bit Access Time (ns) 187.5 210.09 93.75 60.0
32 bit Longword Access Time (ns) 375.0 210.09 93.75* 60.0

*Note: assumes a 32-bit memory port on the enhanced configuration.

The problem with the original table was that the Falcon was being listed
as using 2 clock synchronous bus cycles as dictated by terminating the cycles
with *STERM. This is not correct, as the Falcon nominally has a 16 bit data
port to its memory resources. Synchronous bus cycles using *STERM are not

supported on the 68030 unless the data port is a full 32 bits wide. There is another form of "synchronous" bus cycle which does utilize the *DSACKx mode of cycle termination. This is called synchronous because all signals are sampled relative to clock edges. However, this mode also has a minimum cycle time of 3 clocks, as does the standard asynchronous bus protocol. Therefore, even with 0 wait state access to memory the Falcon accesses memory in 3 clocks, as does the A1200.

Wrong. The Falcon audiosubsystem has 8 channels. Simply use the XBios-call setmontrack() to setup the channels. The DSP has nothing to do with this (no mixing of channels!).

Yes, certainly. But the DSP CAN do this things (look at the first demos called plasma30 or speeder2 - zooming, rotating, texture-mapping with 50KHz 16bit MOD-sound), the Amiga 1200 can't (aehr... that means can't without tricks - surely someone is finding a way to do this, but only in some very special cases, same thing like all this ST-demos 'emulating' an Amiga 500).

Ciao, Heiko.

>(16-bit) or better samples, and your samples grow exponentially.

Yes, playing MODfiles with the DSP isn't that easy... but:
While calculating you can get the next sample in the DSP-RAM. This is done by
DMA with 1 MByte per second. You can also connect the DSP output via DMA to
the ACS. So, your player must have a little intelligence but it is possible.
You can even transform sample larger than 90 KByte because it's not necessary
to keep the whole sample in the RAM.
If it is possible to play 8 channels with 50 KHz with such a player - i don't
know...

Ciao Heiko. (Hi Greg, i'm waiting for your response...:)

It's more like 80-90% longword fetches except for loops that fit into the
tiny cache. That's because all instruction fetches are done with longwords.

>Data and instruction cache: NOW I'M POSTING IT THE THIRD TIME: the Falcon
>caches increase the speed of memory fetching and register access with more
>than 100% (Tested with Quick Index from Darek Mihocka and other benchmarks).
>So, the big question: Which CPU is faster?

The cache does not increase the speed of memory fetches at all. It also does
not speed the register access at all. It just avoids instruction and data
fetches going to memory and the merits depend on the program in question.

Especially benchmarks tend to overemphasize cache effects as these are
pretty small. You also see (in these benchmarks) large effects because
the difference in speed between the cache and the 16bit memory is enormous
(i.e. your 100%). For your average code this does not say much as such
code either doesn't fit into the cache or uses more data than fits into
the data cache. So for most programs the machine with a 32bit memory system
wins over a 16bit memory system with a data cache (remember, the 020
has an instruction cache as well).

You are still on drugs? You don't access registers any faster if you
had zillion megabytes of both I & D cache. Claiming that only shows
people that you really have no idea on what you are tlaking about.
(I'm sorry if I'm sounding a bit rude, but I'm a bit tired of this
kind of sentences).

> than 100% (Tested with Quick Index from Darek Mihocka and other benchmarks).

Yeah, benchmarks have ALWAYS been the BEST ways to determine how much
caches help....

> So, the big question: Which CPU is faster?

68030 is of course faster than 68020 if it's potential if used. If
not, it may well be, and if crippled enough, is slower.

The 68030 will always need a longword. Even if a byte or word as asked for. The extra cycles wil be wasted, which is why people say that 16 bit RAM on a processor with a 32 bit data bus is crippling. The data will always need to be multiplexed to get it into the processor. This is a major slowdown. The 256 byte caches in the 68030 don't help very much. They help a little but not anywhere close to 100% like you say. They help 10-20% depending on the application. If you are running a benchmark that is very small and runs in the cache then you will see your 100% mark. But on any real-world test you are only going to see about a 15% speedup with the caches on.

Well YES and NO. If what you are doing is mainly moving memory around, with the instruction cache enabled, then yes the AMIGA will be faster. Since both processors "MOVE" instruction take the same number of clock cycles to execute the 14% faster cpu in the Falcon starts to close the gap, for those processing cycles.

Now if you start doing other types of processing that use the pipe-line within the Falcons 68030, and its faster clock rate will more than make up the difference. One of the interesting things you can do with the 68030 is change the sequence of instructions to get a vast inprovement in throughput:

A simple example:

```
mul d1,d0
move d0,(a0)+
move d4,d5
```

runs much slower than

```
mul d1,d0
move d4,d5
move d0,(a0)+
```

The reason is in the second part of the example the processor does not have to wait for the mul to complete before executing the move d4,d5. Why? Because the pipe-line noticed that the move d4,d5 instruction was not dependent upon the result of the mul d1,d0 instruction, and there fore could execute the move d4,d5 in parallel with the mul d1,d0.

With the 68020 this kind of thing can only happen if you are using the FPU.

Brian

Actually, I found your post on the Atari Jag quite amusing and enjoyable.
(And it only made me want to buy the thing more)
However, your reply to this post is more distrubing than anything else. Your
not saving pictures of Jodi Foster are you?

>

Ahhh.. most Dictionaries don't have the latest trendy words related to
computers.
(if your confused, It just means that the term "3D Polygons" isn't in
an english dictinary.)
But to answer HIS question: The is nothing wrong with 3D polygons. (with the
exception of you can't have anything appear 3D on a single 2D computer
monitor). Sure bitmap graphics look nicers but they are generally messy.

****SIGH****

Why can some weenies only think in terms of absolutes? Atari is a small
company so they only need a small percentage of the total market share
to remain solvent. I don't care if my computer is the most popular
machine around as long as enough sell so that there's software available
for it.

Keep your petty macho contests on the playground.

## 620. Calamus Import TABS Problem - Can anyone help?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-06-18 20:40:18 UTC
From: wabe@ukc.ac.uk
Message-ID: <4952@eagle.ukc.ac.uk>
Source record: 22656

Of late I had the problem of getting a text file ( with TABbed output so that I could make columns ) into the Calamus (v_1.09) that I have. The problem is that Calamus (on ASCI input) will insist on converting TABS to spaces - although, once a TAB gets inside, Calamus understands what to do with it.

I solved this problem by a _very_ long-winded procedure i.e. import the file as ASCI into Calamus - then save it as a .CTX (Calamus text file) - then go into a hexadecimal editor ( I used XXED.PRG ) and copy its header - then append to this the "original" text file with TABS - save as a .CTX file - and then import this into Calamus. The TABS then go in OK although you dont get ALL the file being inputted (I solved that one by inputting TWO concatenated copies of the same ASCI file and trimming off the excess!!). What a palaver!! - needing hexadecimal editors etc. etc.!!! If only SIGNUM2 could print in the Landscape mode on my SLM605......

SURELY, there's a more elegant way of doing this, but my manual is useless on this problem and I fear that Halco (Sunbury) - the official UK importers - will be as useless as ever if I bother contacting them (again). If anyone out there has met this one AND SOLVED IT - PLEASE let me know.

Thanks in advance,
W. Alan B. Evans.

Umm, 50Khz 16bit Mods? I've seen both these demos and both played a
couple of standard mod files in the background (I have both in my mod
collection). The scaling and rotating was rather impressive though...

"Mods", by nature, end up reusing their samples, a LOT. So there is
little value in this. Additionally, that calculation is still going to
mean that it will need that in RAM for a while--its got to read it, step
by step, and pipe it through whatever operations you're doing on it.

Additionally, this still means that you're wasting precious CPU time on
something that should be mind-numbingly simple.

: DMA with 1 MByte per second. You can also connect the DSP output via DMA to

This won't solve the limited RAM problem.

: the ACS. So, your player must have a little intelligence but it is possible.
: You can even transform sample larger than 90 KByte because it's not necessary
: to keep the whole sample in the RAM.

True, but the problem is that you're dealing with 4-8 channels, all of
which need the information. Additionally, most of that is done by
overwriting what doesn't need to be used--the solution you claim would
end up being a constant stream of data between RAM and the local ram, all
being controlled by the CPU, which would have to have full control over
the playing in order to know what's going on.

As a result, you're STILL involving the CPU, and quite a bit of it.

: If it is possible to play 8 channels with 50 KHz with such a player - i don't
: know...

Oh, I'm sure it is. Its got enough width to do it accurately up to, hmm,
probably 8. ;)

: So, the big question: Which CPU is faster?

Remember, there is NOTHING about the Falcon's caches which are "black magic". BOTH the 020 and the 030 have a cache, the differenc being in size. This IS a help, yes. However, caches aren't magical, and they can't always help. In both cases, when the information needed is IN the caches, you're fine, but any time you ever have to fall back to the ram in the system, the Amiga's 020 can actually address that ram faster.

Umm, there are SEVERAL ways to do this. None of that means its easy. My
whole claim in this is NOT that the Falcon has an incapable audio system,
that's dumb. It's very, very simplistic, and that's part of the
point--the Falcon's audio system is EXSPENSIVE in resource time as
complexity grows because, in the end, of their choice of DSP.

I thought that the difference was not size, but in the number.
Doesn't the 030 have both instruction and data caches, while the
020 only has an instruction cache? If I recall correctly, the size
of the caches in both chips is 256 bytes each...

>can't always help. In both cases, when the information needed is IN the
>caches, you're fine, but any time you ever have to fall back to the ram
>in the system, the Amiga's 020 can actually address that ram faster.

Why doesn't someone settle this once and for all by writing a program
that is too big to fit into the cache(s)? Have it toss around a few
large arrays or bitmaps and see which machine can do it better. To
make it even more fun, have it also be blasting audio, scrolling the
screen around, and other such things that the Amiga and Falcon should
be good at. Write it in C or C++ for portability, and have a couple
of programmers on each platform produce the code. No hacking at the
assembly language level is allowed, and the programs must run atop the
OS, not by taking over the machine.

Any takers? Or just a bunch of chickens afraid to put up or shut up?

Two physical outputs, but up to 8 channels, which can mean 4 tracks of
stereo sound, streaming through the DSP with 16-bit clarity at CD (44.1),
DAT (48), or even 50khz.

Go see the product literature for Cubase Audio or any of the currently
available direct-to-disk recording applications.

That's my point exactly. The DSP handls it. No the CPU. And this is
something the Amiga can't even do at all. As in, "Only the Amiga makes it
impossible." :)

>: Yep, that's the plan.
>
>And it's not a good solution; MIDI is fine for some things, but not for
>everything. Often MIDI is overkill. Sometimes, MIDI is incapable of
>doing what a competent audio system could. The Falcon's audio system
>isn't incompetent, its just expensive to use.
>

I didn't say MIDI was the only solution, but it is the #1 use for an Atari ST
or Falcon machine. Check what markets these machines go to. An Amiga owner's
#1 use for sound is going to be for games probably. An Atari user is probably
more concerned with MIDI. To each his/her own.

Built in audio doth not a musician's computer make. Remember the Apple IIGS?

The point is, when it comes to doing the tasks a professional musician would
want, an Amiga is not as capable as the Falcon. And even a stock ST has
more software support for external hardware to do direct-to-disk recording

and MIDI than the Amiga has.

Yes, I know it will grate to know the Amiga is not the end-all be-all of computing, but hey... the Falcon is far from perfect either. But there are some things Atari has done to serve their market niche (musicians) that Commodore cannot change with the Amiga 1200, especially in light of the Falcon's release.

>: Who said we were talking about games? If you wanna play games, go get

>than a few situations where you wouldn't need or want to do things over
>MIDI.

Oh of course. When you wanna play games, you may not wanna use MIDI. But how many games want to use 50khz 16-bit samples for an explosion that sounds adequate sampled at 8khz mono?

It's like me saying that an Atari 520ST is as capable f a video machine as the A1200 because when you play breakout, it only uses 32k of video RAM and delivers "identical to the arcade" graphics and thus, is superior because it doesn't use so much video RAM, blah blah blah...

:)

>
>: In case you forgot, the discussion began with the ludicrous claim that
>: the Amiga sound chip can handle 50khz sampled sound playback as good

Nope, everyone did not know it. Because I got a reply waaaaaaaaay back saying the Amiga can do it. Now it's good to know we all agree the Amiga sound system can't reproduce a sound above 14khz.

>very specific, aimed at the expense and inadequacy inherent in the
>Falcon's audio system.
>
And I'm sure the 8-bit Paula chip that cannot make a sound higher than 14khz has all the things that make the Falcon's sound system so woefully inadequate. :)

>: I knocked that one out the ballpark.
>
>Unfortunately, you were playing football.

That's true. And the average user also doesn't know how much CPU time is spent playing MODs and whatnot on their favorite sound card, and the average user doesn't care. :) Because they get their work done on their machine. :)

>: But alas, this is subjective! For, as the gentleman who uses Sonix claims,

>expensive in resources.

Well if it were that expensive, how would the system be able to do d-2-d recording while handling MIDI sequences and running the OS? You'd like for everyone to believe the system slows to a crawl and nothing can get done on the Falcon because of the DSP and it's 96k of RAM of memory.

You forget that the 56001 is best used as a processor that takes effect on streams of data... such as incoming audio signals.

Wait a minute! It can, but it is an expensive thing to do. If you set the clock period too fast the DMA will be skipping bytes, but you can drop DMA and feed it yourself with the processor. Ghastly amounts of interrupts though. (Or hoging 100% cpu time and busy-wait.)

Technically, I don't think you could get away with USING data caching in memory that could be altered out from under you; without a lot of snooping, which isn't happening on the Falcon. Its why CachePreDMA() and CachePostDMA() flush the data cache. ;)

So, no, the Falcon can't really make use of its data cache, in the same way that an Amiga can't use its data cache while it is in chip ram.

As an aside, I thought that they had different cache sizes. Can't quite remember. :)

: Any takers? Or just a bunch of chickens afraid to put up or shut up?

I'm not entirely sure of the value of such a test. That's all.

In article <1vvgur$ehh@cville-srv.wam.umd.edu>, Dragon's Claws (cmedley@wam.umd.edu) wrote:
: Two physical outputs, but up to 8 channels, which can mean 4 tracks of
: stereo sound, streaming through the DSP with 16-bit clarity at CD (44.1),
: DAT (48), or even 50khz.

That's my point. There are two physical channels. However, there's only one piece of hardware on the falcon that combines the 8 channels down to the two physical ones--and that's the DSP. Again, my point is that what is provided by hardware and what is provided by software are two dynamically different things.

If you want more than one channel left, one channel right, you use the DSP. That's not BAD, but because of the way they integrated the 56001, its a one-application thing.

: Go see the product literature for Cubase Audio or any of the currently
: available direct-to-disk recording applications.

That's my point. They're using the DSP. Yes, its hardware, but technically, the mixing is happening in software, and going to the two physical channels. The Amigas is SIMILAR, but not the same--our mixing happens in HARDWARE. We've got four logical channels, and they are combined through some logic into two physical channels. The hardware allows for you to alter the way in which the mixing takes place, but its basically doing exactly what the DSP is doing on the Falcon.

: That's my point exactly. The DSP handls it. No the CPU. And this is
: something the Amiga can't even do at all. As in, "Only the Amiga makes it
: impossible." :)

Fine, then we agree. UNFORTUNATELY, and here's where my point comes in, the Falcon's 56001 cannot do its own DMA--it must be fed, "babysat" if you will.

: I didn't say MIDI was the only solution, but it is the #1 use for an Atari ST
: or Falcon machine. Check what markets these machines go to. An Amiga owner's
: #1 use for sound is going to be for games probably. An Atari user is probably
: more concerned with MIDI. To each his/her own.

Technically, my #1 use for sound is my MantraManager program. :)
Nothing like gothic meditations as a background sound.

: Yes, I know it will grate to know the Amiga is not the end-all be-all of
: computing, but hey... the Falcon is far from perfect either. But there are

No kidding. :) Neither are perfect. The Amiga's audio system, while being very basic, is nowhere near current professional standards, and in many cases, nowhere near current PC user standards.

But there are, as I have pointed out, many basic flaws in the Falcon's design that would eternally turn me away from it in the way that reminisces the Mac LCs.

: Oh of course. When you wanna play games, you may not wanna use MIDI. But
: how many games want to use 50khz 16-bit samples for an explosion that sounds
: adequate sampled at 8khz mono?

Eek, nothing sounds good sampled at 8khz. Nothing. :) Even outside of games, there are uses that the Falcon will not handle well, but the Amiga will, simply because of their choice of DSP.

: Nope, everyone did not know it. Because I got a reply waaaaaaaaay back
: saying the Amiga can do it. Now it's good to know we all agree the
: Amiga sound system can't reproduce a sound above 14khz.

Yup. Did I ever tell you I knew Nyquist personally? :)

: And I'm sure the 8-bit Paula chip that cannot make a sound higher than
: 14khz has all the things that make the Falcon's sound system so woefully
: inadequate. :)

Except for the higher sampling rates and width, yes.

: That's true. And the average user also doesn't know how much CPU time is
: spent playing MODs and whatnot on their favorite sound card, and the
: average user doesn't care. :) Because they get their work done on their
: machine. :)

Well, the only thing they notice is that their word processor updates a lot slower when they're playing that really cool music in the background. So they turn it off. (and this I _DID_ notice.)

: Well if it were that expensive, how would the system be able to do d-2-d
: recording while handling MIDI sequences and running the OS? You'd like

Because with a good DMA system, direct to disk recording is a no-brainer. It's a memory funnel. MIDI is just a stream of data. And hopefully, your OS doesn't have enough overhead that "running the OS" becomes a concern.

However, try using a DTP program during all of that. Then turn it all off, and watch the difference.

: for everyone to believe the system slows to a crawl and nothing can get done
: on the Falcon because of the DSP and it's 96k of RAM of memory.

Perhaps you should try DOING something as it.

: You forget that the 56001 is best used as a processor that takes effect on
: streams of data... such as incoming audio signals.

And as such, by nature, demands that something always be feeding it data. Since the 56001 cannot CONTROL what is being DMA'd to it, it can't do the work on its own.

Which is why the 3210 is such a leap over the 56001, aside from the performance differences. It HAS a full 32-bit address bus, and is CAPABLE of getting its own stuff because it can access whatever it needs by itself. No babysitting necessary.

And the Falcon has FastRAM and a 33mhz 68030 for those that are willing to pay.

But out of the box, what do they have?

<and of course, I could always say that software will take advantage of the Falcon's DSP a lot more readily than the Amiga's... and on top of that, adding the faster TT-RAM to a Falcon is supported by Atari since the TT was available...)

But guess what?

The 3210 DSP is not shipping now for the Amiga. And it does not come
standard in any currently shipping models.

It will also add significantly to the cost of the machine.

Also, software will be written for that lowest common denominator.. the A1200.
A machine with no DSP.

So, flaming away that the Falcon's DSP isn't quite good enough whe the Amiga
lacks one to begin with is somewhat.... odd.

C= has announced a 3210 based DSP card for the Amiga, and I've heard rumors
of a new Amiga machine with it built-in, but nothing concrete.

But right now... as we speak and compare Falcons and A1200s, Apples and
Oranges, Big Blues and Big Reds... Amiga ain't got no DSP.

Actually the size is identical. The 68030 adds another cache for data
accesses, which is the same size (256 bytes) as the instruction cache.

> This IS a help, yes. However, caches aren't magical, and they
>can't always help. In both cases, when the information needed is IN the
>caches, you're fine, but any time you ever have to fall back to the ram
>in the system, the Amiga's 020 can actually address that ram faster.

This is actually a bigger issue than one would think. Yes, the caches
help a great deal when references are highly localized. However, such
localization tends to be a good bit less on a multitasking platform than
it would be on a single-tasking setup, by nature of context switching.
While the caches on the Falcon's 68030 do indeed help a good deal to overcome
the limitations of that machine's 16-bit port to memory, they are no
substitute for a system equipped with a full 32-bit memory port.

It's not a crippled '030, the '020 came before the '030 and the '020
had the 68851 MMU on another chip.

|> The Fs' 030 has a 16 bit wide data bus which cripples

But cost less (the A1200). The only way the EC020 on the A1200 is crippled
is when you run it without fast ram, otherwise, it isn't.

The 'EC020 on the Amiga. Why? First, you are forgetting the 256 byte
cache (inst cache) of the EC020 too.

Now the most important part:

YOU ARE RUNNING A STUPID BENCHMARK. RUN AN APPLICATION, AND TURN OFF AND
ON THE CACHE AND SEE THE DIFFERENCE IN TIME.

The cache in the '030 helps, but having a 32-bit databus helps more, and again,
you are forgetting the EC020 has a 256 byte instruction cache.

Are you saying an Amiga has a better sound system than the Falcon?
Amiga 1200 that is. I do not think anyone (except maybe Atari) is claiming
that it is perfect, but you must admit that it is pretty darn impressive.

Will it really? Remember now that the end user will have to pay for the
card with the DSP on it, and they will have to pay for all the precious
packaging, etc... that goes with it.

Now, I remember hearing someone say in comp.sys.amiga.advocacy about a month
ago that C= left an onboard clock out of the A1200 for cost reasons... whether
this is true or not, I got some wild flames for saying that was silly because
clock circuits are cheap.

But I would say that until the card ships, we won't know if the real world
price of it + an A1200 is comparable to a Falcon. So this really can't
be argued about....

<although arguing is the basis of the advocacy groups, right? :) >

I don't believe that statement to be true... totally.... granted, some s/w
will not be written for non-DSP systems, but I think a higher percentage of
Falcon applications will use the DSP than will Amiga applications considering
that it is standard on the machine.

Well, let's go through a list of goodies not in the A1200:

1) built in high density floppy drive (1.44MB). They still use the archaic
880k format that the A1000 came with on this new super computer.

2) no onboard clock. You know, backing up that hard drive incrementally kinda
needs the current date....

3) ...but since the Amiga lacks SCSI-2, I guess you'll be using IDE and won't
be so worried about data as you can only hook up two IDE devices, so you
won't lose so much data because your floppy disks make backups tedious (moreso
because there is no system clock to let you do it incrementally)

4) points 1-3 lead to such a massive loss of data that the 32-bit path to
the CPU is irrelevant because all of your data is constantly being lost and
you find yourself more productive on another Commodore machine.. the C64. :)

If we all want to get picky, out the box, not many machines are what we want.
So ask yourself what you want to do with it, and then do it with your machine.
But don't try to argue that your view of a system's architecture should be THE
official view of everyone who reads news. If you don't like the Falcon, don't
buy one. Vote with your money, and not with your mouth. :)

Criticizing for what they should have done while advocating a company whose
machines are, at best, marginally better or worse.... is silly.

Well, let's see your list of complaints about the Cray YMP. I'd love to see this. Let me guess... no onboard sound chip makes it useless for multimedia, so hands down, the Amiga beats the Cray?

<now why didn't they worry about that when they made it? What a design flaw!>

Hmmmm. This is so convincing, but guess what? Atari, NeXT, and SGI all use the Motorola 56k series of DSP. So there is SOMEONE using it. Use your DSP, I'll use mine. :)

I agree with all of Flip's points (except point number 4, of course :)
I have to disagree with the policy of calling these things 'crippling'
though. Lack of a high density floppy by no means cripples the Amiga,
and the lack of a 32 bit data bus by no means cripples the Falcon.
They are merely disadvantages. They just tend to piss us off because
they were all extremely avoidable disadvantages. Now that the Amiga
users have conceided their handicaps, and the Atari users have conceided
theirs (you have, haven't you?), perhaps we should all turn our guns
towards the Mac or something. :)

I do not argue this point. I did the maths some time ago and it is quite
clear that the F030 is slowed down a hell of a lot. What I am talking about
is compromise and trade offs. What is gained in one place is lost in another.
for example, the A1200 uses IDE and not scsi II. That sort of thoughlessness
about I/O is brushed over by A1200 users but is important.

I refer you to the ongoing debate concerning the T800 and T9000 transputers
for parallel programming vs the C40 DSP for parallel programming.

I do not follow it that closely (the heat left it some time ago when the
T9000 transputer came on the scene) but the C40 DSP *wasn't* being used as
a DSP but as a general purpose CPU with comms abilities that made it perfect
for parallel computing work.

Now, this means that a DSP is perfect for DSP work, but, oh wonders, it can
do *so* *much* *more*!

You get a Z- for insight and less for imagination.

BTW, the C40 out classes the 56001 by a vast margin, but the principle of
recignising a DSP for what it is (ie a co processor) is likely to be missed unless
it is *very* clearly pointed out to those with a less than subtle mind.

cheers

Xavier

: a DSP but as a general purpose CPU with comms abilities that made it perfect
: for parallel computing work.

: Now, this means that a DSP is perfect for DSP work, but, oh wonders, it can
: do *so* *much* *more*!

Yes. Similar fights can happen over the 56001 and AT&T's 3210--while
both are good DSP's, the 3210 offers many more "general purpose"
capabilities, allowing you to do much more.

: You get a Z- for insight and less for imagination.

A poor defense for the MIPS benchmark won't get you anywhere with me.

: Hmmm, interesting. I was talking to some geezer who swears a good MOD will
: fit in about 16K! I had better check that out:(

Ya, I'd say. It all depends on the samples themselves, and their length
and quality; those factors have a great deal of impact on the resultant
size of the mod file.

Greg

What a crock of shit.
Any ECS or upwards amiga can do any play back rate in the range of
28khz to 448khz, in four channels fully cpu independent [dma driven].

Wrong. As I posted previously a play back rate of between 28khz and 448khz
is possible on an ECS or AGA amiga.

The fact is the amiga can give you a factor 280ns precision on your audio play
back while both the ST and the falcon cant offer better than 20000ns precision.

Right, where is the problem?

>Additionally, this still means that you're wasting precious CPU time on
>something that should be mind-numbingly simple.

Wasting? Come on, this does not need very much CPU time. I've said it before:
even on an Amiga PAULA doesn't play the MODs himself. You need the CPU to
control the music.

>True, but the problem is that you're dealing with 4-8 channels, all of
>which need the information. Additionally, most of that is done by
>overwriting what doesn't need to be used--the solution you claim would
>end up being a constant stream of data between RAM and the local ram, all
>being controlled by the CPU, which would have to have full control over
>the playing in order to know what's going on.

Yes, you have to control the data flow... but i think, these few XBios-calls
shouldn't cost more than 1% of CPU time - you won't remark it.
There is a second possibility to manage the data flow: you can use the Host
interface between the DSP and the 68030. This interface is able to move
8 MByte (not MBit!) per second. This is quite a lot, but it has one
disadvantage: you CPU and DSP must control the flow themselves (with DMA you
only have to set the sender and the receiver). Overall it should be
possible to use both, the DMA and the Host interface.

>As a result, you're STILL involving the CPU, and quite a bit of it.

I've never mentioned that the Falcon can play MODfiles without using the CPU
a (very very) little bit.

>(: (: (: (: Have you overdosed on smileys today? Why NOT!?! :) :) :) :)

No. :)

Ciao, Heiko.

If i would be an Amiga owner i would also be frightened about the MIPS rating :)
So what's your suggestion how to compare two different computer systems?
The DSP IS fast, and this is a fact. It has the ability to process most of
its instructions parallel. It has a 20ns onchip DSP-RAM. It also has a very
fast DSP-RAM.

Ciao Heiko.

Why is everybody pointing on the music ablities of the Atari ?
Because it *WAS* the leading platform on MIDI/Recording.

But do you see what is happening today ?

R*l*nd does not sell any Atari Software anymore. They completedly changed to DOS/Mac.

Harddisc-Recording is the coming feature. The Falcon is ridiculous, although it seems to have everything to do recordings, the limitation on only *two* recording channels at a time will keep him out of the buisness.

The fabulous D*G*DESIGN Session 8 will never be available for any Atari platform.

The market is changing and Atari did not jump on the train.
How sad !

Ciao
Uwe

Whoa... I've heard that the 4i/4o module from D2D Systems does 4 channels
of recording and 4 channels of playback at once off the Falcon.

I'll give a point here to the Falcon: although the DSP on the Falcon
is not as good as the 3210 (guys, the Falcon DSP is old, old, old relatively
speaking), definitively and without doubt, the Falcon has better
sound that any current Amiga out there right now.

I'll give credit where credit is due. If I where a musician, I'll feel
very attracted to this machine (Falcon). Now on a general practical world
basis, I think the A1200 is better.

Registers THEMSELVES are kind of like cache; however, registers
THEMSELVES are never cached. Caches store instructions or data based on
their location in real memory, they have nothing to do with caches.
Registers are blindingly fast already, they don't magically get faster
when you add cache--they may get more use, due to the CPU waiting less
time for its data to "appear", but that's it.

: Why not?? Are you testing the CPU speed with a stopwatch?

Using MIPS as a benchmark, to make an analogy, is like testing your CPU
with a sundial on a cloudy day.

So what? My point is that talking about crippled CPUs is, apart from
rather emotional, not very realistic. The world is filled with trade offs.

I for one think the A1200 I/O capabilities are barely adequate. It is
however quite clear that many Amiga users are happy with the current
configuration.

>|> The Fs' 030 has a 16 bit wide data bus which cripples

>is when you run it without fast ram, otherwise, it isn't.

The machine is not the CPU, whatever you have been told! Nor is the machine
just a matter of a 16bit data bus or a 32 bit data bus. All these debates
are rather simplistic and lack subtlety. Stop being so rabid, try to be more
balanced.

-> 4) points 1-3 lead to such a massive loss of data that the 32-bit path
-> to the CPU is irrelevant because all of your data is constantly being
-> lost and you find yourself more productive on another Commodore
-> machine.. the C64. :)

Why writing so many shit ??? It's not interesting at all, not real
(check your fact...), and not brillant.

MY A1200 HAVE a clock, and the IDE in MY A1200 offer enough performances,
and all your stories about incremental backup are totally useless and
innacurate.

Please, STOP talk about your crippled SCSI-2, and start talk about
performances (REAL WITH TEST PLEASE!!!).

Users don't really need know how it's do (scsi/ide) when performances are there.

The A1200 can be buy by peoples that not want a big computer, and also
by peoples that want many more and want afford a little more to have
clock and memory, accelerator and more ...

... your Falcon is ridicously high priced for ANYBODY that want it.

Anyone that need a computer with a 030 range power will go buy an A4000/030,
wich is a better performances/functionnality/value than a Falcon.

AH, yes!!! Another point ... is ALL software running in an original ATARI ST
can run on a FALCON ? (Ok, i will be smart, talk only about productivity
software...).

Another question : what chip, or some processor, have been made by ATARI?

Since MiNT and GEM, and MS-DOS, have not be do by ATARI, but included in
their computers, what are the part of OS that have been do *BY* ATARI?

Is ATARI able to do anything by itself ???

Another point : Many people here talk about paula chip, and DSP.
I remark you that AT EACH TIME ATARI introduced a new sound technology,
they have broke compatibility, and have to include ALL SOUND chips to
keep-it. Is the FALCON-2000 will have 250 sound circuitry ? ;-] ;-]
It's very EASY to do things same of it, and C= have surely been able to
released us DSP 16 bit DAC technology, but i think C= is more SERIOUS
and have ind mind to respect all they have do before, to not loose
compatibility, without add and add and add circuitry uselesly (a manner
that take priced high, as ATARI do). I didn't talk in my hat about that
point : see what C= have do with AGA, they keep maximum compatibility, and

more with OCS (than ECS do with OCS).

Bye!

>The DSP IS fast, and this is a fact. It has the ability to process most of
>its instructions parallel. It has a 20ns onchip DSP-RAM. It also has a very
>fast DSP-RAM.

This is all fine and well. However, the only true method for comparing different computer systems is through applications and subjective usage guidlines.
Benchmarks are a way to give an indication of system performance, when used properly. They in no way give the full picture. All too often people are swayed by what seem to be incredible benchmark numbers, and then surprised when in their own use of the system it does not seem to hold up to those numbers. All systems must be viewed as a whole, with great consideration taken as to what they will be used for.
For example, you can have a fantastically fast processor in your brand spanking new toy. However, your use of the system tends to bind to to a great many I/O operations. Now, if that system with the whiz-bang processor demon from the seventh plane has a slow I/O subsystem, you aren't going to see the same kind of performance as someone who uses it for simply processor-intensive operations, and certainly you aren't going to see the same performance as processor-intensive benchmarks will show.
The methods usually used to calculate MIPS on a machine are particularly bad when it comes to any kind of comparison. In general, they tend to stress only one or a few kinds of instructions, which a processor may be particularly good and fast at doing, while leaving other common ones out of the calculations. In doing such, these tests show a bad example in that no real-life application is going to be restricted to using this small subset of instructions under such an idea situation. In fact, most applications

will not have anywhere near the same instruction layout and conditions as a typical MIPS test.

I'm happy that the Falcon has a DSP. Its a nice addition to the system. However, it is not some magical device that quickly removes any of the other disadvantages that the Falcon suffers from. To top, the Motorola 56001 is a nice device, but it is not the fastest or most advanced on the market today. In fact, it is a relatively old offering in the market. This is not to say that it is not useful, but the constant talk on here about the DSP being some miracle device on the Falcon needs to be tempered with a more real-world attitude towards the system as a whole.

I've designed and programmed DSP hardware boards (a TMS320C30)
in assembly, and before I did I thought that they were magical
devices that were so fast that I didn't have a care in the world
about potential speed problems. Wrong! They aren't as fast as
what I thought (though they are still very fast) and now see them
in a more realistic light. Sure they are more powerful than many
680X0 CPUs with FPUs, but they are not so powerful that
they can do anything. But they are a nice addition to see in the
Falcon, but I'm waiting to see one in the Amiga one day...

Stevie

Well, it IS brilliant, IMHO. And true, more or less.

>MY A1200 HAVE a clock, and the IDE in MY A1200 offer enough performances,
>and all your stories about incremental backup are totally useless and
>innacurate.

'enough performances' - sheesh - compared to what? The disk drive?
My friend's A4000 has got four drives (Quantum LPS240, LPS105, Syquest 5110c
and the original crappy 120MB-IDE-Seagate), and though he does only have an
Oktagon controller (no Fastlane Z3 - yet), the Seagate is the slowest by far.

>Please, STOP talk about your crippled SCSI-2, and start talk about
>performances (REAL WITH TEST PLEASE!!!).

'performances' again, eh? Seems this word means something different in this
part of the world...

>Users don't really need know how it's do (scsi/ide) when performances are there.

BZZZZZT, wrong! Sit down and learn something about SCSI devices vs. IDE
devices (including SCSI laser printers, SCSI scanners, MODs, etc.)

>The A1200 can be buy by peoples that not want a big computer, and also
>by peoples that want many more and want afford a little more to have
>clock and memory, accelerator and more ...

>... your Falcon is ridicously high priced for ANYBODY that want it.

Wrong again! The Falcon 4/0 and the 4/65 (4/80 in the USA?) are somewhat
overpriced IMHO, but the 1/0 is available in the Netherlands for a very
good price (though 1 meg is useless for a Falcon, but so are 2 megs for
an A1200), about 700 US$.

>Anyone that need a computer with a 030 range power will go buy an A4000/030,
>wich is a better performances/functionnality/value than a Falcon.

And has no MMU, I'd prefer a 4000/040.

>AH, yes!!! Another point ... is ALL software running in an original ATARI ST
>can run on a FALCON ? (Ok, i will be smart, talk only about productivity
>software...).

All productivity software works, including such dirty programs as Signum!3
(and 2?, not sure here).
Even some games run on the Falcon, similar to the A1200, many games would
NOT run, but that was predictable.

>Another question : what chip, or some processor, have been made by ATARI?

VIDEL, CODEC,....

>Since MiNT and GEM, and MS-DOS, have not be do by ATARI, but included in
>their computers, what are the part of OS that have been do *BY* ATARI?

No part of the OS, because ATARI can't write programs, only programmers are
available to do so and ATARI is a company, not a programmer. BTW the
author of MiNT now works for ATARI, does that count? And he is obviously
rewriting most of DRi's/ATARIs sources right now.

This is necessary because the GEM desktop runs in supervisor mode most
of the time, making MultiTOS sssssllllooooowwww.

>Is ATARI able to do anything by itself ???

Nope, is C=? Remember: the EGS library exists, RTG doesn't.

>Another point : Many people here talk about paula chip, and DSP.
>I remark you that AT EACH TIME ATARI introduced a new sound technology,
>they have broke compatibility, and have to include ALL SOUND chips to
>keep-it. Is the FALCON-2000 will have 250 sound circuitry ? ;-] ;-]

Perhaps, but eventually the original Yamaha chip will not be used by
Falcon programs, so they will be able to throw it away sooner or later.
And remember: the A4000 disk drive is slow in HD mode because C= did
NOT integrate a new chip.

>It's very EASY to do things same of it, and C= have surely been able to
>released us DSP 16 bit DAC technology, but i think C= is more SERIOUS

Maximum compatibility should be a matter of PC clones, not of C=. I consider
it a terrible disdvantage that AA is incapable of giving you 800*600
noninterlaced, not even with tricks (see ScreenBlaster/BlowUp030 for
the Falcon).

Well, that may be right... but it doesn't matter. For all i know, the Falcon
has only one CODEC which can handle all 8 channels simultanously (to be more
specific: the Falcon has 8 channels for recording and 8 channels for playing).
How they managed this physically doesn't interest me.

Ciao, Heiko. (More Smileys!)

>dynamically different things.

No! You are wrong here...
The DSP has nothing to do with mixing the 8 channels.

>Fine, then we agree. UNFORTUNATELY, and here's where my point comes in,
>the Falcon's 56001 cannot do its own DMA--it must be fed, "babysat" if
>you will.

No problem, because the most time the DSP is waiting for the data to arrive,
even with a 50 KHz sound. In most cases (transforming frequency, effects like
echo, flanger etc.) the DSP is faster than the transport of the data via DMA.

Ciao, Heiko.

No reason to become cruel...

>MY A1200 HAVE a clock, and the IDE in MY A1200 offer enough performances,
>and all your stories about incremental backup are totally useless and
>innacurate.

My Falcon has a 32 MHz 68030 with 32 MByte Fast RAM. Who cares?

>Please, STOP talk about your crippled SCSI-2, and start talk about
>performances (REAL WITH TEST PLEASE!!!).

I take the opportunity to present the benchmarks i have made regarding the
speed increase with the Falcon caches:

Cache Cache
ON OFF gained:
LHarc 2.20 packing 680131 Bytes to 235576 Bytes 82 s 97 s 18 % *
ST-Zip 2.2 packing 556465 Bytes to 145141 Bytes 100 s 233 s 133 % *
GEMView depacking a 416x580 JPEG image (dither) 41 s 64 s 56 %
GFA-Basic compiling 10506 Lines (>200 Kb) 29 s 61 s 110 %
Calamus SL calculating a Testpage 24 s 33 s 37 %
LaTeX compiling 19 pages (MultiTEX, C.Strunk) 118 s 137 s 16 % *
TopazFractal calculating a 608x415x256 Fractal 26 s 58 s 123 %
Paula MODfile player -> CPU-loss when playing: ~30 % ~60 % ~100 %

Tests with a '*' had frequent Harddisk access.

Who mentioned that the speed increase with Caches isn't worth talking about?
Please note: These tests are not selected to get better figures. If somebody
knows other tests which need massive CPU time let me know - i will also check
it out.

My suggestion still stands: The 16bit data bus will be a little disadvantage
when using caches.

>AH, yes!!! Another point ... is ALL software running in an original ATARI ST
>can run on a FALCON ? (Ok, i will be smart, talk only about productivity
>software...).

I don't know any GEM-based software which is not running on the Falcon.

>Another question : what chip, or some processor, have been made by ATARI?

For example: Shifter, Blitter, Glue... (the 64 bit RISC in the Jaguar?)

>Since MiNT and GEM, and MS-DOS, have not be do by ATARI, but included in
>their computers, what are the part of OS that have been do *BY* ATARI?

The whole Amiga Hardware wasn't done by Commodore. MultiTOS was done by Atari
(and that's different to MiNT!). But, why should they do all their software
themselve??

>released us DSP 16 bit DAC technology, but i think C= is more SERIOUS

First of all, their users had to be serious.

Ciao, Heiko.

The Question is: Does your A1200 have a built-in Clock or is it on a Ram-Card?
^^^^^^^^
>
>Please, STOP talk about your crippled SCSI-2, and start talk about
>performances (REAL WITH TEST PLEASE!!!).
O.K. Here you get Numbers! My System is: A4000/40 10MB RAM
Seagate 3144 AT
Quantum LPS240S SCSI
Quantum LPS105S SCSI
Syquest 5110C SCSI
The SCSI-Host Addapter is an Oktagon 4008 (Zorro II), which works on PIO and
needs much CPU-Time for pulling. (No matter: 68040 is real fast! Beleave it!)
Now for the Speed: LPS 240S ~1600000 Bytes/s
LPS 105S ~1200000 Bytes/s
Syquest 88MB Cart. ~980000 Bytes/s
" 44MB Cart. ~490000 Bytes/s
Seagate ^910000 Bytes/s

Now for the built-in IDE: I hate it! It's slow and it crashed my Data for
three times since i have my A4000 (Yes, my MaxTrans is corrected).
And it's the most reason for Incompability (Not the 68040 :-( ).
>
>Users don't really need know how it's do (scsi/ide) when performances are there.

I like Karsten's post because it was intended for the "end user" aspect. I have to admit that one thing I like about C= A12000/4000 line is the A4000/40 which is quite a powerful machine. I personally wouldn't mind having one for various "fun" purposes. :)

<yes, an '040 may be a bit much for "fun" but what are computers for? work? :)>

>duties of Federated...

Indeed, it is impossible to perceive a 3D polyhedron. All you can
see is the 3D polygonal surface. If you don't believe in 3D polygons,
then you can't see anything. Which is evident.

ObAdv: "Wa Wa Warwick"? Surely you can do better than that. Flame me
and I'll be the wick for a flame war to keep it burning.

Oh give it up Allosaurus, the POLYGONS ain't 3D, period. When they are used
to map the surface of a polyhedron (no need for the 3D part, it's implicit)
they're like that poor chap from Flatland on his grand tour. They're still
2D but living in a 3D world.

And about this impossible to perceive crap... You can take those polygons
right off of any polyhedron and just fill it with smoke and if you use dynamo-
magnetic ultra osmotic suction or some other mysterious force (kind of like
the one that keeps Atari in business) to hold the smoke inside the space bounded
by the polygons then voila, you can perceive the polyhedron Soredick...

|>

> with it!

I have a couple of questions here:
- What's the refresh rate on that 1280x960 resolution?
- What resolution is the machine capable of with no extra hardware? (and
at what refresh rate and pixel depth?)

You don't really have to have a card to do this on a Mac (although the
monitor would be just as expensive for both machines). The Centris C610
you're comparing to does 1152 x 870 at 75 Hz vertical scan rate,
noninterlaced, out of the box. The built-in hardware can be programmed to
run at 1280 x 960 at a similar refresh rate (again, noninterlaced) with no
extra hardware. This is close to the top end of the C610's video hardware
capability. If you wanted to program the same or higher resolutions at
lower scan rates (interlaced or noninterlaced) so you could work with
cheaper monitors, that's just a matter of software - no extra hardware
needed. The C610 video hardware is certainly capable of producing
resolutions like 2K x 2K, although at reduced scan rates and pixel depths.

> better, and
> it will come, but then not just naked, just like in a MAC, but with DSP,
> good graphix, etc.

You really should be a bit more consistent here. First you advocate
adding a slew of hardware add-ons to the Falcon, and then say that Macs
come 'naked' and Ataris don't. Well, which is it? Do you need
those hardware add-ons to compete or not? I can add all sorts of things
to a Mac, too - 40 MHz '040s, dual DSPs, RISC-accelerated rendering
boards, etc...

The '030 is certainly not "up to date". Cheap, yes. But it's hardly
current technology. You'd want at least an '040, preferably at 40 MHz
(which is roughly 3 times the speed of the 36 MHz '030 you claim will make
your system "up to date"), although even that's starting to look a bit

slow compared to the competition.

# 677. WHAT IS ATARI DOING WRONG? -- Please reply e-mail if possible

Newsgroup: comp.sys.atari.advocacy
Date: 1993-06-23 16:19:15 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <209vq3$r8h@usenet.INS.CWRU.Edu>
Source record: 22612
Cross-posted to: comp.sys.atari.advocacy,alt.games.lynx

Please reply by e-mail if possible. This will allow me to capture all responses easier and won't waste space.

Thanks!

I plan to send a long letter to the President of Atari U.S., Garry Tramiel (since he seems to be showing at least some leadership at Atari) and I would like for you to give me your input.

If you have observed a problem concerning Atari that you believe is hurting the company and the Atari Community, please let me know what it is.

Some topics that I have seen mentioned here in the past that I would like to hear more about may be:

Dealers getting blacklisted (or just ignored).
Dealers having problems with Atari concerning orders, etc.
Past dealers having problems with Atari concerning orders.
Dealers that have not signed the Atari Dealer agreement or have signed, but are unhappy with it.
Lack of Atari computer dealers in your area.
Lack of Lynx dealers in your area.
Lack of game cards at Lynx dealers.
Lynx dealer having problems with selling the Lynx and game cards.
Developers problems (lack of support, etc. that prevent a developer from getting software out.
Developers having distribution problems (especially overseas).
Lynx programmers having problems finding distributors for their games.
Lynx programmers not getting paid from Atari on time.
Atari publications not getting enough information from Atari on what is going on with the Falcon030, etc.
Atari publications not getting paid for Atari advertisements or not getting paid on time.
Atari User Groups not hearing anything from Atari concerning anything.
Atari computer users that cannot find Atari dealers.
Atari computer users that cannot find software and hardware.
Atari computer users that feel the computer platform that they purchased is being unsupported (and why you feel that way).
Atari Portfolio users that are not happy with the support that they are receiving or not receiving.

There are of course, MANY MANY things that are not listed that you can let me know about.

But, let's make this letter even better. What do you think Atari needs to do to correct the problems that you see. Or how would YOU correct them.

Now, what has Atari been doing that you believe they are doing right?

Some topics:

The "no mail-order policy" agreement.
Shipment of Falcon030 orders.
Free update to "Atari Works" to owners of the Falcon030.
Making Multi-TOS availabe to all ST users.
Attending Atari Shows.

I am sure this list can go on and on...

So, what I really need to know is:

What have YOU noticed Atari doing wrong that has been hurting the company? What do you think they should do to correct the problem? Or what would you do to correct the problem?
What have YOU noticed Atari doing right that has contributed to the company's success?

Please let me know if I should leave your name on your concerns or if I should remove it?

Also, let me know where you are from.

Even though this is to Garry Tramiel of Atari U.S., all international users may send me their concerns as well.

I will post the response to our concerns PUBLICLY when I get one.

Thank you.

Doesn't the Falcon have an SDMA (sound coprocessor) to
in pump out digitized 16bit sound, thus freeing up the DSP
for other things? I seem to remember an SDMA being mentioned
in the Falcon specs...

Let me know please.

Allen

Believe it or not, I've been "advocating" the Falcon without knowing that it has a 4 channel SDMA 16-bit sound engine.

So Mr. Block's claims about the DSP, sound, CODECs, trackers, etc...have all been under the same assumption I guess, and would also be incorrect.

<my source is the spec sheet for the Falcon given in str923.lzh which was the most recent listing of Falcon specs I'd seen>

Interestingly enough, the Falcon won't play back 6.25khz samples like the STe, but every other sample rate,from 12.5khz on up to 50khz.

So our beloved DSP isn't just gonna be bogged down doing trackers. :)

My point as a whole has been that the Falcon is a better all round machine than
the A1200. It has disadvantages, true, but here on c.s.a.advocacy the debate
has been centred on the graphics speed and the difference in architecture.
Not on the Falcon as a whole.

There is a special deal on Atari joysticks from Arizona. These are brand new, shrink-wrapped in their original boxes. The sticks work with Atari 800, Atari ST, Commodore 64, Commodore 128, and the Amiga Home Computer, or can be adapted for use in your own projects.

For more information, send mail to meco-info@indirect.com

Put the word "joystick" as the subject line and the mail server will E-mail you the information.

Well, I had an amazing experience with someone at the Atari order line, when I called to order 'Joust'. When I asked for two, the guy expressed his astonishment, and then said "I didn't think anyone would buy this game... it's so old."

Then I complained to him about Atari's lack of marketting for the Lynx, telling him that I wouldn't of known about Joust except for the network. I did compliment the company on their recent (back then) glossy flyer that had been included in the newspaper.

"Oh, yeah", he said, "I hope we never do anything like that again. You wouldn't believe how busy we've been taking orders. It sucks." I am not making this up. And he was serious.

My recent call to the order line asking about the availability of Lemmings yielded confusion. The woman I talked to said that she'd never heard of the game and didn't think Atari was going to carry it. Don't the salespeople get any notification of upcoming titles?

Lastly, I wrote to the head of marketting at Atari about a year ago, suggesting that they get an internet account (I even suggested they use Portal, a local cheap internet service). I told her how Atari would benefit by the large number of Lynx devotees on the network, and how such a large body of users would provide valuable marketting feedback.

I never got an answer, and so far, Atari isn't here.

Also, lets look at the product in question: the 486 computer.
Question, who makes it? Yes, IBM, BUT there are another 300 or so
manufacturers from Dell to mom and pop stores who make them. Probably 90%
of them a DWARFED by Atari.
I own one, mine was built by me, componet by componet. So my 486 is techinaly
made by no one.
So, lets avoid unfair comparsions.
Do you know who makes sells more personal computers than anyone else?
Answer: Apple.

Is all realitive. I wish more users were like Jonathan.

: has been centred on the graphics speed and the difference in architecture.
: Not on the Falcon as a whole.

The Falcon, as a whole, is a crippled machine with poor software support,
a poor operating system in both design and API, and poor architecture.
As a whole, the Falcon is not something I would recommend purchasing, nor
would I myself purchase it, to anyone other than the niche the Falcon
fits into, it is a poor example of a general-purpose machine.

Reasons AGAINST the Falcon have been given. For the Amiga? PCMCIA comes
to mind. AGA is a good solution, but more importance can be placed on
the advances in the operating system, and in the API they've provided and
continue to provide. Full object orientation would be a step up, and
hopefully we'll see that too. Software support may not be wonderful, but
it isn't awful, in comparison to the Falcon OR to other, non-mainstream
OSes. While it isn't Windows, it isn't TOS--it's somewhere inbetween,
and our software support exemplifies that. Hardware-wise, the 1200 has a
much cleaner architecture, as does its close cousin, the A4000
architecture (030 and 040). Architecturally, the 1200 has, in addition
to its "processor slot" underneath, a PCMCIA bus, a true expansion bus.
The drawback of the existence of IDE could be considered a costly one,
yes. But when it comes time to upgrade, the Falcon's architecture will
work against you, while the 1200's will not.

So, taken as a whole, I oppose your view.

Greg

Nope, it's not an educational price. In fact, it's not even the lowest
price available to the general public. CompUSA has them for under US$1250. You do need to
add the cost of a keyboard to that price, as well as the cost
of a video monitor (another US$400 or so, depending on how cheap a monitor
you can live with).

Replace 'Falcon' with 'A1200', it fits perfectly :-)

>Reasons AGAINST the Falcon have been given. For the Amiga? PCMCIA comes
>to mind. AGA is a good solution, but more importance can be placed on

AGA lacks bandwith and picture frequencies >60Hz in other modes than
Super72. PCMCIA may become great, but it isn't yet. There is no SCSI
host adaptor, only a cheap IDE controller that has been criticized by
A1200/A4000 users several times, but obviously you don't read other
groups than *.advocacy. And - there is NO HD disk drive for the A1200
and I doubt there will be one.

>the advances in the operating system, and in the API they've provided and
>continue to provide. Full object orientation would be a step up, and
>hopefully we'll see that too. Software support may not be wonderful, but
>it isn't awful, in comparison to the Falcon OR to other, non-mainstream
>OSes. While it isn't Windows, it isn't TOS--it's somewhere inbetween,

You don't know anything about the availability of software for Atari
computers, you'd better read an Atari mag, at least ONCE!
And what do you mean by saying 'while it isn't Windows (bad), it isn't
TOS (quite good)--it's somewhere in between', are you really trying to
convince us that OS 3.0 is WORSE than TOS? I always thought both OSes
had their advantages and disadvantages without even trying to rank one
of them higher than the other.

>and our software support exemplifies that. Hardware-wise, the 1200 has a
>much cleaner architecture, as does its close cousin, the A4000
>architecture (030 and 040). Architecturally, the 1200 has, in addition

The 'cleaner' architecture is based on chips with very limited capabilities,
see disk drive handling, the magical 14kHz sound frequency limit and the
missing capability to display higher resolutions with 4:3 ratio at 60Hz
noninterlaced (min.) than 640*480.

>to its "processor slot" underneath, a PCMCIA bus, a true expansion bus.
>The drawback of the existence of IDE could be considered a costly one,
>yes. But when it comes time to upgrade, the Falcon's architecture will
>work against you, while the 1200's will not.

The Falcon has a 'processor slot' inside, allowing you to add e.g. a
32 MHz 68030 with up to 128MByte FastRAM (burst mode) and a VME bus
adaptor (this card costs 800 US$ and is available, a 68040 is projected
by Fredi Aschwanden, the developer who is selling his 68040 board for
standard STs right now), a 16bit RAM slot allowing you to put up to
14Mbyte 16bit RAM into it (comparable to the Amiga Chip RAM).
What you mean by stating 'the Falcon architecture will work against you'
is that you have to open the Falcon's case, using a screwdriver.
Sure, this is a main disadvantage for anyone not able to use a screwdriver
in the appropriate way, but not for me.

I was discussing this with some friends, it seems that almost no one at
atari that has contact with paying custormers (or deallers) really care
about the company. It could go under tomorrow, they could really care less.
I ordered some carts for the 7800 directly from atari awhile back. the first
time i got a sales rep that never even HEARD of the system. But after a long
hold, he got the information from me and I had the game. Then another
time I called in and it was lunch time and somewho I got switch
to a secetaries desk. Not only was she able to take my order, she was able to
comment about the games and we talked for about 20 mintues. I complmented her
on her enthusiasm. She said that they hardly hire anyone who plays games,
their more concerned on who will work the cheapest.

>
>My recent call to the order line asking about the availability of Lemmings
>yielded confusion. The woman I talked to said that she'd never heard of the
>game and didn't think Atari was going to carry it. Don't the salespeople get

Hmm.. I thought we had an advocacy group for this kind of articles. But of
course I may be mistaken -- it's friday night and I'm quite tired, so can't
guarantee that my mind is fully functional...

But if I'm not mistaken: PLEASE PLEASE PLEASE post articles to their
appropriate newsgroups, people. Some of us actually PAY to receive their
news, and some of us thus carefully decided which groups to subscribe to
and which not. This kind of non-appropriate postings is costing people all
over the world tons of money. Not very social, is it?

Thank you. And have a good weekend.

: >fits into, it is a poor example of a general-purpose machine.

: Replace 'Falcon' with 'A1200', it fits perfectly :-)

The software support for the Amiga is several times better than that of the Falcon, and third party hardware for the Amiga is very alive. That removes my first statement.

"Poor operating system in both design and API" applies well to MultiTOS. It does not, however, apply to AmigaOS, which has a VERY nice API, which continues to become more powerful (such as the addition of DataTypes and BOOPSI gadget systems), and while lacking in VM and MP, still has a very good and extensible design. The shared library concept adds to that capability, on the Amiga, making the operating system easy to extend and build upon.

: AGA lacks bandwith and picture frequencies >60Hz in other modes than
: Super72. PCMCIA may become great, but it isn't yet. There is no SCSI

Vertical sync is programmable. Currently, the only 72hz modes are the Super72, but that is NOT a limit of the chipset.

: host adaptor, only a cheap IDE controller that has been criticized by
: A1200/A4000 users several times, but obviously you don't read other

I criticize it myself, I don't need others to. And yes, it is a cheap IDE controller. So don't use it; it doesn't cripple the design unless you try to use it in place of something better, and you don't have to.

And yes, as I said, I'm aware of the extra expense. But the freedom from the architectural crippling that took place in the Falcon is more than enough of a counterbalance.

: groups than *.advocacy. And - there is NO HD disk drive for the A1200
: and I doubt there will be one.

Eh? 1) A1200's use an IDE adapter, HD's exist; but that's PROBABLY not what you meant. You were likely referring to SCSI, and then you're still wrong, because they DO exist. They don't come from C=, but there are

others.

: You don't know anything about the availability of software for Atari
: computers, you'd better read an Atari mag, at least ONCE!

I HAVE. And? You're just a little off the mark if you think the Falcon has anywhere near the software support _CURRENTLY_ available for the Amiga.

: convince us that OS 3.0 is WORSE than TOS? I always thought both OSes

Hell no, 3.0's several times more capable, in features and design, than TOS or MultiTOS ever was. That's easily proven by the things they've done with it. And that's getting better, not worse. 3.0 offers object orientation and data-independent display capabilities, as a starting point.

: had their advantages and disadvantages without even trying to rank one
: of them higher than the other.

TOS, as an OS and an API, including MultiTOS, is an inelegant, backwards operating system that should probably never have been born. Now that it's here, they should work a lot harder, though.

: The 'cleaner' architecture is based on chips with very limited capabilities,
: see disk drive handling, the magical 14kHz sound frequency limit and the

Which doesn't exist--I had forgotten that the limitation doesn't exist on ECS systems, which are most of the systems in existence. 44+khz is easily possible.

Limited capabilities? AGA is limited only in bandwidth--it offers far more than the Falcon does, both in the programmability as well in the OS support for the graphical modes of the system.

: missing capability to display higher resolutions with 4:3 ratio at 60Hz
: noninterlaced (min.) than 640*480.

While the Falcon is limited by a very primitive external clocking mechanism, and a crippling memory architecture that could have been a lot better than it ended up being.

: The Falcon has a 'processor slot' inside, allowing you to add e.g. a
: 32 MHz 68030 with up to 128MByte FastRAM (burst mode) and a VME bus
: adaptor (this card costs 800 US$ and is available, a 68040 is projected
: by Fredi Aschwanden, the developer who is selling his 68040 board for
: standard STs right now), a 16bit RAM slot allowing you to put up to
: 14Mbyte 16bit RAM into it (comparable to the Amiga Chip RAM).

How many of them are there? One slot. Pick what you want, and it had better be a nice, big, multifunction one--because you can't use more than one. Putting a 24-bit processor-direct slot in was moronic, at best. Pulling off the 68000-compatible lines onto a connector is no better than our own processor slots--fortunately, we've also got an actual BUS to do

things with.

: What you mean by stating 'the Falcon architecture will work against you'

A quick peek at the wiring of that processor slot shows that quite well.

Greg

The main point here is that the Atari has standard MIDI ports, while on
anything else you have to look for an add-on MIDI port elsewhere. That's
not to say that either one performs better than the other or is even
necessarily less expensive, but having standard equipment is a big step
in having software to use that equipment.

>> or the

Ever heard of Calamus? I'm no DTP expert but Calamus SL is certainly a
high-end, professional application just as much as Pagemaker on the Mac.
The major difference is that so far, Calamus only runs on the Atari
platform while Pagemaker runs on Mac and MS-DOS. As far as quality and
performance goes, Calamus is right up there with the others.

Here we go again... Why does everyone keep comparing high-end computers
(like a 486-50 or a Quadra) to the Falcon? Sure the Mac can have 1152x960
at 75 Hz, but just how many LCIIs or Performas out there have that
capability? It's not built in and to get that kind of graphics out of a
low-end Mac you still need to buy extra equipment. If you want to compare
something, try a TT with a graphics card or something, but lets not keep
whining because the Falcon can't beat the pants off a machine running at
4 times the clock speed.

>facts and then make up their own mind. The Falcon at its price point is
>expensive and slow, and the DSP is not a general solution, but a specialized
>co-processor with lots of limitations.

Ok, let's see just what kind of Mac I get for the price of a Falcon. I
just saw a SILO ad in the paper today (a general appliance/electronics/
everything store), where they were advertising a Mac Performa 405 with
a 16 MHz 68030 (at least I assume that's what it uses, the ad didn't
say), an 80MB hard drive, and 4 MB of RAM (plus some included software).
Sound familiar to anyone? The system was selling for $1299. The only
difference between that and the Falcon is that it comes with a monitor
while the Falcon requires you to buy a $200 VGA monitor. Admittedly,
that makes the Falcon less of a deal but it seems to me the Falcon
price is not that far off from the Mac systems. Now, if you want to
talk MS-DOS that's another story, because you can probably get a
486SX of some sort for about $1299 as well.

And the Amiga has vast software support!?!?! hehehehehehehe....
And I syppose the technologically advanced Amiga 1200 with it's huge
880k double sided 3.5" disk drive, no built in clock,and a 14mhz 68EC020,
is the solution to for general purpose computing!

heheheeheheh!

If I didn't have to plan a cookout tomorrow, I'd flame you. :)

>a poor operating system in both design and API, and poor architecture.

Poor operating system? Ever tried MiNT? Ever noticed that the ST line
is not limited to just running TOS, but also MINIX, OS/9, and with emulation,
Mac and PC OSes?

And let's remember that on the Amiga, until recently, you couldn't even drag
a window so it was paritally off the screen. :)

>As a whole, the Falcon is not something I would recommend purchasing, nor
>would I myself purchase it, to anyone other than the niche the Falcon
>fits into, it is a poor example of a general-purpose machine.
>

I'll admit, I'd buy an A1200 or a Falcon, with or without their faults, if
I am using them for the purposes for which they are well suited. For
video work, considering the s/w base, cost, etc...the A1200 would be my
choice. In fact, despite my constant flaming of the machine, I'm seriously
considering an A1200 or 4000 as a possible purchase before the end of the year.
Likewise, for music (especially for the direct-to-disk recording) I'm
definitely interested in the Falcon.

Both machines would benefit from a price reduction in the US.

>Reasons AGAINST the Falcon have been given. For the Amiga? PCMCIA comes
>to mind. AGA is a good solution, but more importance can be placed on

Can you substantiate what is so great about the Amiga API? I'd like something
more than just "It's greeeeeeeeat!", because unlike kids watching Tony the

Tiger, I'd like a reason to believe you. :)

>continue to provide. Full object orientation would be a step up, and

It sure ain't TOS. Local cable company's Amiga crashes all the time. I
enjoy seeing what happens on the channel when that happens. Makes me feel
glad I'm not relying on one for 24 hour usage. :)

>and our software support exemplifies that. Hardware-wise, the 1200 has a

So, the Falcon's architecture is "Working against" the user? I think a
SCSI-2 port is built for the future, unlike the IDE. Of course, the Falcon
includes IDE too, so the point is moot. It has both. It also has a
1MB/s DSP direct port. Can you say s/w modem? :) Two 15 pin joystick ports
that can be adapted to myriads of uses by 3rd party developers. This is
in addition to two standard 9 pin ports for mouse and joystick. Not to
mention the serial and parallel ports. And the Localtalk ports.

That's FIVE major I/O ports the A1200 doesn't even HAVE. Sure, add the on
later, but tell me how much it costs to add two more joystick ports,
a DSP, SCSI-2,and Localtalk capability.

>

Well you have disqualified yourself already when talking about operating
systems, it was in the very moment when you settled the quality of OS 3.0
somewhere between TOS and Windows. Ask any PC user.

I was NOT referring to hard disks, sorry, I was just talking about the
impossibility to hook a disk drive into the A1200 that is able to handle
more than 880K disk space. Don't say 'this exists for the A4000', we are
talking about the A1200 here!!!! (BTW: even the high density handling
of the A4000 is crap.)

Great for bats and dolphins, eh? Human ears are limited to sound frequencies
from 20 to 20,000 Hz. What you are talking about are SAMPLING frequencies.

>Limited capabilities? AGA is limited only in bandwidth--it offers far
>more than the Falcon does, both in the programmability as well in the OS
>support for the graphical modes of the system.

I see :-). Have you recognized yet that ONLY the graphical modes of the
system are supported, no graphic cards etc.? Neither EGS nor RTG are part
of the OS and the Picasso was the first graphics card offering you screen
mode files.

>: The Falcon has a 'processor slot' inside, allowing you to add e.g. a

In article <20go9n$1fe@cville-srv.wam.umd.edu>, Dragon's Claws (cmedley@wam.umd.edu) wrote:
: >The Falcon, as a whole, is a crippled machine with poor software support,

: And the Amiga has vast software support!?!?! hehehehehehehh....

In comparison to the Falcon, oceans of it. The Amiga's software support isn't really that bad--we're missing all of the big names in the rest of the business, perhaps, but we've got more than our share of good developers.

: And I syppose the technologically advanced Amiga 1200 with it's huge
: 880k double sided 3.5" disk drive, no built in clock,and a 14mhz 68EC020,
: is the solution to for general purpose computing!

In my opinion, yeah. Why? because that 68EC020 is accessing memory faster than your Falcon is, the "backwards" chipset is accessing the chip ram and making use of page-mode to get 64-bytes per access, and I'll easily forgo a disk drive for a good HD and controller, and drop in a cheap clock while I'm at it.

THAT'S why. It's not crippled. It may have some things that are missing, and it may have some things that fall short, but NONE of it makes it less of a machine.

: Poor operating system? Ever tried MiNT? Ever noticed that the ST line
: is not limited to just running TOS, but also MINIX, OS/9, and with emulation,
: Mac and PC OSes?

Yes. And? NONE of that makes TOS anything worthwhile. TOS is a beast. MiNT/MultiTOS doesn't change that a great deal, it just turns it into a Unix-looking beast.

: And let's remember that on the Amiga, until recently, you couldn't even drag
: a window so it was paritally off the screen. :)

You still can't. The only time you could was a long, long time ago, when there was a bug in the OS. You can, however, and you could do this with 1.3 but without support for it on the Workbench, create a large, virtual screen, and have your visible portion "lock down".

: Can you substantiate what is so great about the Amiga API? I'd like something
: more than just "It's greeeeeeeeat!", because unlike kids watching Tony the
: Tiger, I'd like a reason to believe you. :)

BOOPSI, object orientation. Taglist functions. Clean, hierarchical design. The use of shared libraries as the base functionality of the

operating system, loaded on-demand, allows for easy extension and high efficiency. Lightning-quick message passing system based on passing pointers rather than the unixy-method of passing blocks of memory. Callback hooks in OS functions. And one of the fastest context switches around, thanks to Exec's design.

: It sure ain't TOS. Local cable company's Amiga crashes all the time. I

Local cable companies have been using 1.3, which is KNOWN to be extremely buggy. Our local one just upgraded to 2.04, and has a rather innovative look to the new system. I imagine this is common--the Prevue guide is national. Its been a long time since ANYONE had to rely on 1.3 for daily living, 2.04 has been around for a long time. 2.1 was released a while ago, too, and AGA folks are using 3.0 now. 3.1 will be released "real soon now".

: So, the Falcon's architecture is "Working against" the user? I think a
: SCSI-2 port is built for the future, unlike the IDE. Of course, the Falcon

Yes. But the existence of IDE doesn't prevent you from adding one. Of course, on the Amiga, you can add something and NOT close out the system's potential, we've GOT a real expansion bus.

: 1MB/s DSP direct port. Can you say s/w modem? :) Two 15 pin joystick ports

Waste of a DSP, IMHO.

: that can be adapted to myriads of uses by 3rd party developers. This is
: in addition to two standard 9 pin ports for mouse and joystick. Not to
: mention the serial and parallel ports. And the Localtalk ports.

Yes. And? None of this will make that system any faster, none of it erases the flaws in the architecture.

: >The software support for the Amiga is several times better than that of
: >the Falcon, [...]

: Sure it is.

It is, simply put. Ever hear of Comeau C++? Its a multi-platform C++ made for many types of workstations. AND the Amiga.

Ever hear of SAS? SAS makes some of the most widely-known products in the industry, in general. They also do our, and others', most popular C compiler, SAS/C.

Electronic Arts, perhaps, of the popular DeluxePaint fame. We won't even get into that.

You may or may not know Blue Ribbon Soundworks... Bars & Pipes Professional?

Ever hear of NewTek? Nah.

Those are just a few names that you might recognize--not because they're popular Amiga developers, but because they're known across the industry for the products they make.

Then of course, theres prevalent Amiga developers like GVP, Black Belt, Centaur, SunRize, ReadySoft, Digital Creations, ASDG, and a GREAT deal more. There is a disparate difference between the state of the Amiga's software development and that of the Falcon/Atari.

So, yes, "better software support". And hardware as well--we've got more than just a few hardware demons, including the legendary GVP (well, they're legendary on the Amiga because they've been around for eons).

: Well you have disqualified yourself already when talking about operating
: systems, it was in the very moment when you settled the quality of OS 3.0
: somewhere between TOS and Windows. Ask any PC user.

Typing mistake. I had meant to say somewhere between Windows and OS/2, between horrible and great, not between Windows and TOS, between horrible and WORSE.

: Sure? Prove it! Write an 800*600@72 Hz screen mode file.

Yes, there is a bandwidth limitation, I did mention that. However, as long as you don't go over that bandwidth, you could do 72hz. There are 640x480 modes that have 72hz, as well as 640x400, and more. The bandwidth available is the one big limitation with that chipset, but if you work within it, 72hz isn't a problem.

: 'In place of something better' refers to SCSI here, what is the price for
: an SCSI interface for the A1200?

Why not ask those who bought them? Many use the old IDE because they don't need anything more. On the other side of the fence, how many Falcon owners went out and bought SCSI-II drives?

: Unproved statement again.

Eh? Weren't you on the planet when I was discussing the architectural miscarriages in the Falcon?

: I was NOT referring to hard disks, sorry, I was just talking about the
: impossibility to hook a disk drive into the A1200 that is able to handle
: more than 880K disk space. Don't say 'this exists for the A4000', we are

You can. Buy the Amiga high density drive. It just doesn't come with the A1200, that's all. There's nothing special about the A4000/A3000 that allows them to use HD drives.

: talking about the A1200 here!!!! (BTW: even the high density handling
: of the A4000 is crap.)

Yes, it does. Limitation of having custom chips doing the work, and not upgrading them quickly enough.

: The Falcon has all the software support the ST/TT line has, because every
: GEM program runs on the Falcon in any resolution.

AND? You still think this is even close to the available Amiga support?

: And it does not offer RTG, Ataris handle graphic cards perfectly.

Most graphic cards available now handle themselves in a retargetable fashion now, the companies just have to do the work themselves. While not an optimal solution, it does give us RTG.

: Inelegant, as in 'there is no trashcan on the Workbench to drag&drop files
: into'? Or as in 'double clicking GIF/JPG files will not call an application
: that is able to handle them'? Or as in 'memory protection is not integrated
: in the OS'?

As in, nothing to do with what it looks like.

You think we worry about double clicking on GIF/JPG files to get the right application? No. We've got DataTypes, and if we need to, we just let the Operating System recognize what type of data we want to display, and do so. And there are more and more datatypes becoming available, with several really nice ones on the way.

I meant API.

: Great for bats and dolphins, eh? Human ears are limited to sound frequencies
: from 20 to 20,000 Hz. What you are talking about are SAMPLING frequencies.

I thought I said that. I'm sorry.

: I see :-). Have you recognized yet that ONLY the graphical modes of the
: system are supported, no graphic cards etc.? Neither EGS nor RTG are part

No, I haven't, and neither have the folks with graphics cards. You're
way off base.

: of the OS and the Picasso was the first graphics card offering you screen
: mode files.

No, Picasso wasn't the first.

: You are the first one to tell me that the A1200 is better of here than the
: Falcon. Well this 32MHz card offers a VME bus, look at the specs for this
: bus first.

I'm perfectly aware what a VME bus is. That's why I said you'd better
pick a good multifunction card.

And I guess prominent ST developers (the CodeHeads come to mind immediately)
who are still around are just incompetent programmers?

The ST market has it's share of good programmers too, and a lot do shareware
and freeware as well as commercial applications.

And of course, we both know the Mac and DOS markets are so huge they have
many many more people writing apps who are just as competent, regardless of
how incapable you or anyone else may feel the computers themselves are.

>: And I syppose the technologically advanced Amiga 1200 with it's huge

Yes, you will have fast access to memory, but because AmigaDOS lacks VM,
having a fast hard disk is non-essential. So you use IDE. But you and I
both know Atari put SCSI-2 *and* IDE on the Falcon. Why can't Commodore
offer their users that much flexibility? Perhaps they decided to make
a tradeoff you (and others) find acceptable... improve memory speed at the
cost of I/O in other parts of the system. Hence, the use of "only" IDE,
the lack of built-in networking ports, the lack of optional joystick ports,
and the lack of a standard DSP.

That's a lot to sacrifice. If you think for your needs that letting a 68020
fetch 32 bits at a time is worth it, and you agree with C=, then go for it.
Buy one. Make yourself happy.

But as any good engineer would tell you, there are tradeoffs made. Atari chose to make their 68030 go 16-bits at a time to memory, and let their custom chips have full 32-bit access to that same memory. And they also had provisions in place from the release of the TT for "CPU-only FASTRAM". So this "crippling limitation" is in fact only a transitory problem until the user upgrades.

Kinda like the way the lack of abundant I/O features and speed on the Amiga 1200 can be "fixed" with an upgrade.

>
>THAT'S why. It's not crippled. It may have some things that are

I'm still wondering what you mean with SCSI2. Do you think SCSI2
is magnitudes better than SCSI1 or that it's god's gift ?
SCSI2 is only faster if you have a real FASTSCSI HD and your
SCSI2 controller supports 10MB/s Fastsync transfers.
I'm really curious about the Falcon's SCSI chip. Can somebody
tell me what kind of chip Atari is using ?. Before nobody give
details about the SCSI chip, the DMA interface and actual
speed test it makes no sense to talk about it...if you think
of the old Atari SCSI interface you can assume the worst.

BTW i don't understand how somebody can critize the IDE interface
in the A1200. Let's summarize. What were the design goals for the
A1200 ? An Amiga that can be sold in big quantities. Such Amiga
must offer as much as possible and must be cheap at the same time.

o 14Mhz 020EC was a good decision because the chip is cheaper
than a 030EC,needs less place and doesn't need an asynchron
interface(more logic) because of the 14MHZ.

o It's a fact that IDE is cheaper because you don't need scsi-controller
on board that wastes motherboard place. Furthermore the smaller IDE
drives are cheaper than the same SCSI drives.
If you have Fastram in your A1200 you should be able to reach 800-900kb/s
like the A4000 with his 120MB Secrate HD.
You should take a look at the target group of the A1200. Do you think
everybody needs the possibilities of SCSI ?. Do you think there are
so many A1200 users that need more than 1 HD or using streamers ?
Would this group big enough to make the 100$(approx.) price increase
reasonable ? How many customers would CBM loose by a machine that
costs 100$ more ?
Think about that and if you still need more you have to pay for it..

Regards...

> 4 times the clock speed.

You're a bit off base here. The comparision was not to a Quadra. The
comparison was to a Centris 610. This machine is currently selling for
under $1250 at a number of locations (although I've seen reports from
people that have bought them for well under $1200 - from CompUSA, I
believe), and supports a number of high refresh rate video modes, such
as 1152x870 or 1024x768 at up to 8 bits/pixel and 832 x 624 at up to
16 bits/pixel, all at 75 Hz, noninterlaced.

> talk MS-DOS that's another story, because you can probably get a
> 486SX of some sort for about $1299 as well.

OK, let's try another configuration with pretty much equal price (your
message implies that a Falcon costs $1299 - that's for the 4/80
configuration, right?):
- Centris 610 (20 MHz 68LC040), 4MB RAM, 80 MB hard disk: $1249
- Keyboard: $50 for 3rd party keyboard, $100 for Apple keyboard
- Monitor: lets use the same $200 VGA monitor you want to hook up to the
Falcon to keep all things equal (the C610 will drive a VGA monitor with
no problems, although that's near the low end of its onboard video
capabilities)

So, for pretty much the same price as the Falcon system I can get a
Centris system.

>and the lack of a standard DSP.

WTF!? What the hell are "optional" joystick ports? As you know the
Amiga has two of them, capable of both analogue and digital I/O. Who
the hell cares about joystick ports?

Furthermore, what does "improving the memory speed" have to do with
adding netowrking ports and a DSP? Sure, the Falcon has these things
over an Amiga, but it sure ain't becuase the A1200 has a 32bit data path
throughout.

And, oh yes, as pointed out here many times, some PC OS's have VM... and
it works fine on an IDE drive.

>That's a lot to sacrifice. If you think for your needs that letting a 68020
>fetch 32 bits at a time is worth it, and you agree with C=, then go for it.
>Buy one. Make yourself happy.

Oh, its worth it (altho I dont think thats what the A1200's tradeoff
is).

>But as any good engineer would tell you, there are tradeoffs made. Atari chose
>to make their 68030 go 16-bits at a time to memory, and let their custom chips

>in place from the release of the TT for "CPU-only FASTRAM". So this
>"crippling limitation" is in fact only a transitory problem until the
>user upgrades.

Remember this statement. BTW, its still a "crippling limitation" until
you can get the upgrade board to plug into the "32bit slot" (can anyone
confirm that this exists?) on the Falcon.

>Kinda like the way the lack of abundant I/O features and speed on the Amiga
>1200 can be "fixed" with an upgrade.

Er, why speed? You're gonna tell me that the 68030 on the Falcon
accessing its memory 16-bits at a time isn't a speed problem?

>>THAT'S why. It's not crippled. It may have some things that are
>>missing, and it may have some things that fall short, but NONE of it
>>makes it less of a machine.
>>
>It's a machine. That's about all you can say for it. :) But nothing makes
>it the greatest thing since the Atari 8bit or C64, does it?

Come on, my A1000 is better than a C64. THis is pointless.

>>Yes. And? NONE of that makes TOS anything worthwhile. TOS is a beast.
>>MiNT/MultiTOS doesn't change that a great deal, it just turns it into a
>>Unix-looking beast.
>
>And adds full pre-emptive multitasking with MEMORY PROTECTION.
>And it treats all devices as UNIX would, and even processes are handled
>in a UNIX-like manner.

And the GUI and DOS? TOS. I hope you guys fixed your graphics problems
with a "speedup" upgrade.. heh. You would have been better off with
OS/9 and a completely new GUI.

>>: And let's remember that on the Amiga, until recently, you couldn't even drag
>>: a window so it was paritally off the screen. :)
>>

>And this is a technically advanced, object-oriented, refined multitasking
>system that WON'T LET YOU MOVE A WINDOW WHEREVER YOU WANT IT.
>This is hilarious!

Oh, and I suppose I could say the same thing about the UNIX-like
technically advanced MultiTOS locking up during disk drive accesses, but
that would have nothing to do with the API now would it?

>High powered graphics computer, this Amiga...won't let you move a window so
>that it is partially offscreen in the standard OS?

Its not a matter of "let", its a matter of support. It possible to
implement (if you can do overlapping windows, you can surely do that),
but noone found it necessary to implement. In fact, I've seen iconify
utilities and their ilk, but not one utility that added this function.
Hum, you'd think it wasn't so very important wouldn't you?

>Now, I was trying to be nice and assume that by now, this had changed on the
>Amiga. But, you mean to tell me that an ability every machine with a GUI
>worthyofthatname has, is not available on the vaunted AGA equipped machines?

Are you telling us that the ability to clip windows offscreen tells you
something about the API of a GUI? heh... time to write that one down.

Why couldn't Commodore add the "good HD and controller and cheap clock"?
Guess Amiga owners don't do incremental HD backups to their 880k floppies
(although they can do a floppy disk access in the background! Weeeeeee!)

>>Yes, you will have fast access to memory, but because AmigaDOS lacks VM,
>>having a fast hard disk is non-essential. So you use IDE. But you and I

>

>WTF!? What the hell are "optional" joystick ports? As you know the

Optional joystick ports... i.e., the ones you can use when two more friends drop by if the game supports it.

The ones you can also make double as I/O ports for other devices. Surely you have seen various types of devices designed for such purposes, ranging from dinky sound samplers to input devices like touch tablets, etc...

Another set of ports I'd like to add to the Falcon's list are the stereo IN and OUT. Sure, the Ami has stereo out. But in? Yes, that means we

can sample out the box with the Falcon. Just add s/w, no h/w required. :)

>Amiga has two of them, capable of both analogue and digital I/O. Who
>the hell cares about joystick ports?
>

Well, you obviously don't. :)

>Furthermore, what does "improving the memory speed" have to do with
>adding netowrking ports and a DSP? Sure, the Falcon has these things
>over an Amiga, but it sure ain't becuase the A1200 has a 32bit data path
>throughout.

But it may be because the engineers at C= decided that to best serve their intended market, they didn't want to add those items' cost to the machine, but did add the cost of wiring the CPU up for 32-bit access. A tradeoff some people will appreciate and others will barf at. It's subjective. (A point a lot of people can't fully understand, I guess)

>
>And, oh yes, as pointed out here many times, some PC OS's have VM... and

Check the articles regarding CeBit '93 available via FTP at
atari.archive.umich.edu in the atari/Magazines section.

There are two such boards, one from GESoft which adds a 33mhz 68030,
up to 128MB of FastRAM, and VmeBus slot.

>

Never said that. But you sure aren't gonna be able to make an IDE drive
outperform a high-performance SCSI (2) drive. And you sure can't do this
when the machine drops the floppies to half speed to do a 1.44MB disk. And
since the 1200 lacks networking ports, that's irrelevant. And there is no
DSP, so you can knock out yet another big factor in application performance.

>>>THAT'S why. It's not crippled. It may have some things that are

Yeah, right. Well, if it is so easy to implement, why has Commodore not
included it in any of the OS revisions? After all, if they can have
shared libraries, RTG, and all these deep, meaningful features, and they
can change resolution on a single scanline thanks to Copperlists and such,
why can't a window be moved to the edge of the screen and be clipped?

Hmmmmmmmmm?

>but noone found it necessary to implement. In fact, I've seen iconify
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

TOS does it. MS Windows does it. Macintosh does it. Every window
manager I've used under UNIX (twm, mwm, olwm) can do it. But Amiga? No. :)

>utilities and their ilk, but not one utility that added this function.
>Hum, you'd think it wasn't so very important wouldn't you?

Well, hey, I guess it isn't. :)

But then, I guess you've never opened up a lot of windows, eh?

:)

Well, it's kind of like leaving out the bread-'n-butter of a GUI.
You know.. the ability to MOVE (gasp!) a window!

>>>BOOPSI, object orientation. Taglist functions. Clean, hierarchical
>>>design. The use of shared libraries as the base functionality of the
>> ^^^^^^^^^^^^^^^^^^^^^^
>>

>
>Its been done for 7 years, and its still done. Its not slow on even
>floppies, really. If you knew WTH you were talking about, you'd know
>this.

Well, let me give you an example.

A friend of mine boots up on his A500 from floppy to use the modem. He
has no hard drive.

It takes 2 minutes for him to load up and get Baud Bandit up and running.

When I ran a floppy only system, I can get all my AUTO folder programs
running and get to my telecomm app in less than 45 seconds flat.

Now what you're saying is that the next generation of Amiga (the AGA
machines) run adequately off floppy.

I'm sarcastically gonna say... "suuuuuuuuuuuuuuure!"

:)

>
>>>efficiency. Lightning-quick message passing system based on passing

Wow! About the same time! Gee whiz, Batman, I'd never have figured that out!
My point is that there is no big deal to callbacks..they can be implemented
on any system with ease.

Hell, if I can do it in assembler with no effort, anyone can. :)

Touche'. But Atari is doing what they are doing for their own sick reasons,
whatever those may be (apparently financial). They are going to risk their
corporation on the success of a videogame system (Jaguar) and a computer
(the Falcon). Commodore is taking their own approach.

However, to a serious workstation user, the Amiga line probably compares
pretty poorly to, say, a SGI, wouldn't it? :) A typical SGI owner may
think "Gee, when is C= going to stop making game machines?".... :)

Oops, it can do the DSP modem and we'll just pump out 4 channels of 16-bit
DMA sound without it. :) Just can't add real time flanging and chorusing,
and do neato effects on it.

NeXT! :)

>
>

Ever heard of GNU C/C++, the most popular C compilers among both Atari AND
Amiga users, not to mention all the other system where you are provided
with this great compiler?

Ever heard of Pure C, written by the programmers that made Turbo C 2.0
and compatible with it?

>Electronic Arts, perhaps, of the popular DeluxePaint fame. We won't even
>get into that.

Ever heard of PixArt, TruePaint? DeluxePaint isn't THAT popular
any longer, as far as I know. Ever heard of Retouche Professional,
Chagall? Sure these aren't as good as Photoshop, but better than
DeluxePaint they are.

>You may or may not know Blue Ribbon Soundworks... Bars & Pipes
>Professional?

Cubase Audio?

>Ever hear of NewTek? Nah.

Of course not, what does it do? Ever heard of Calamus? Signum?

What you do is just stupid, you don't know anything about the Atari
software market, hence you try to convince Atari users there is more
software for the Amiga. I'd agree there are much more games, but when
talking of application, the Amiga falls back somewhat...and compared
to the PC or Apple market, your statement is completely ridicolous.

>Those are just a few names that you might recognize--not because they're
>popular Amiga developers, but because they're known across the industry
>for the products they make.

I am sure you have interviewed 'the industry' or have at least read some
interviews in a trustable magazine.

>Then of course, theres prevalent Amiga developers like GVP, Black Belt,
>Centaur, SunRize, ReadySoft, Digital Creations, ASDG, and a GREAT deal
>more. There is a disparate difference between the state of the Amiga's
>software development and that of the Falcon/Atari.

I still do not know if I should laugh or cry. You are listing 7(!)
companies, as if it was a proof that there are more developers for
the Amiga. I could as easily list 10 companies, but who cares?

>So, yes, "better software support". And hardware as well--we've got more
>than just a few hardware demons, including the legendary GVP (well,
>they're legendary on the Amiga because they've been around for eons).

The 'number of hardware demons' does not count, products do.
And there ARE more products for the Amiga, if you read the ads, but
most hardware extensions are Z2/3 cards, how do you put them into
the A1200?

>Typing mistake. I had meant to say somewhere between Windows and OS/2,
>between horrible and great, not between Windows and TOS, between horrible
>and WORSE.

You are considering TOS worse than Windows, eh? Ever worked with one
of those? Nope, surely not. Once again: you have no idea what these
OSes behave like when you are using them. You are judging from screen
shots, following the line 'more colours - better OS', yes OS/2 is
good, OS 3.0 is good, and MultiTOS is good - even if the speed
problems have not been fixed yet.

>: Sure? Prove it! Write an 800*600@72 Hz screen mode file.

>you work within it, 72hz isn't a problem.

Seems you are not trying to write this screen mode file, eh? Sorry for
that, I am sure any A1200/4000 user was looking forward to it.

>: 'In place of something better' refers to SCSI here, what is the price for
>: an SCSI interface for the A1200?
>
>Why not ask those who bought them? Many use the old IDE because they
>don't need anything more. On the other side of the fence, how many
>Falcon owners went out and bought SCSI-II drives?

Stop! Even standard SCSI drives are better than IDE drives, don't you
even know THAT? And using old IDE in his A4000 resulted in data loss
three times for Karsten (klump@eva.fmi.uni-passau.de), he'll tell you
HIS opinion on this great C= improvement soon, I presume.

>You can. Buy the Amiga high density drive. It just doesn't come with
>the A1200, that's all. There's nothing special about the A4000/A3000
>that allows them to use HD drives.

It doesn't simply NOT COME with the A1200, it WON'T FIT into it!!!!!
For those who still don't know it: The Amiga high density drive is
1 1/2 inches high, the slot in the A1200 is 1 inch high!!!!!!!!!!!!!

>: The Falcon has all the software support the ST/TT line has, because every
>: GEM program runs on the Falcon in any resolution.
>
>AND? You still think this is even close to the available Amiga support?

Yes, and once again, prove me wrong!

>I'm perfectly aware what a VME bus is. That's why I said you'd better
>pick a good multifunction card.

And sure you are able to put three single function cards into the A1200's
slots, or what?

Well, none of us would have minded if Atari put SCSI1 into the
Falcon, but I'm sure we all would be pissed if the IDE connector
was the only possibility to hook a hard disk inside.

Yes, the A1200 is a good computer (esp. for games), but it is in NO WAY
comparable to the Falcon, that's the problem. The Falcon suffers from
16bit RAM access from the processor, but it comes with lots of features
and interfaces no Amiga provides you with. And that's what those kiddies
are unable to accept.

>
>No, more than that. You see, if you want expansion, you can get an
>A4000. As you said, its all about trade-offs.

Strange, whenever someone states 'the A1200 is better than the Falcon'
and the discussion goes into details, someone comes up with the A4000.

Could anyone please tell me why this happens?

I know the A4000/040 is great, esp. if you add a graphic card and an
SCSI host adaptor to it. It IS better than the Falcon, but it also
costs more money. So, I do not have the money to buy a '040, what should
I do? Buy a 4000/EC030? a 1200? Nope, I think the Falcon is the better
choice here, due to the built-in DSP etc. .

: And I guess prominent ST developers (the CodeHeads come to mind immediately)
: who are still around are just incompetent programmers?

: The ST market has it's share of good programmers too, and a lot do shareware
: and freeware as well as commercial applications.

I'm sure it does--but 1) the ST isn't a Falcon, and it won't get you your
extras, and put together 2) the Amiga's market and development community
is larger.

The state of the Amiga's third party hardware and software support is
simply better.

: And of course, we both know the Mac and DOS markets are so huge they have
: many many more people writing apps who are just as competent, regardless of
: how incapable you or anyone else may feel the computers themselves are.

Yes, and? I wasn't about to argue that the Amiga's software support is
better than the Mac's, that isn't true. However, it is better than the
ST/Falcon's. And that's a reason.

: Yes, you will have fast access to memory, but because AmigaDOS lacks VM,

Buy it. Gigamem. Pretty cheap. No, it's not in the OS, but thanks to
the design of our OS, its not essential; having it in the OS would be
better, but having it as an extension still means having it.

: having a fast hard disk is non-essential. So you use IDE. But you and I

You could. Or, you could just go out and buy it.

: both know Atari put SCSI-2 *and* IDE on the Falcon. Why can't Commodore
: offer their users that much flexibility? Perhaps they decided to make

Because it was aimed at a different market. The market occupied by all
of those A500s out there now.

: a tradeoff you (and others) find acceptable... improve memory speed at the
: cost of I/O in other parts of the system. Hence, the use of "only" IDE,

The I/O can be extended to provide faster I/O systems. You can't do that
to your base architecture. Extension of something good is always better
than extension of something bad. Now, I'm not saying the Falcon suffers
from that, it doesn't--in anything other than their choice of expansion
capability. The base of the architecture doesn't affect anything you
drop into the CPU slot, just as it didn't on any of the old 16-bit

Amiga systems. But its always better to have the base architecture good,
because you can't "fix" it later.

: the lack of built-in networking ports, the lack of optional joystick ports,
: and the lack of a standard DSP.

The existence of two analog/digital ports is, generally speaking,
plenty. Network ports would be nice, yes. Perhaps we'll see that in new
systems in the future.

: That's a lot to sacrifice. If you think for your needs that letting a 68020

Again, you either choose a poorly designed base architecture with good
I/O, or you choose a system with a well-designed base architecture, and
place the I/O upon it yourself. The former is akin to using a PC with
ISA cards; no matter how good your processor and card may be, the bus
will always be your bottleneck, at some point. While the situation is
not nearly as grave, it does have an impact.

: But as any good engineer would tell you, there are tradeoffs made. Atari chose

Yes.

: to make their 68030 go 16-bits at a time to memory, and let their custom chips
: have full 32-bit access to that same memory. And they also had provisions

They could have done both; they could have done much more.

: in place from the release of the TT for "CPU-only FASTRAM". So this
: "crippling limitation" is in fact only a transitory problem until the
: user upgrades.

Except you'll ALWAYS have to access that ram, like chip ram on the
Amiga--it becomes your bottleneck. And as you go to more advanced
processors, the impact of that will get more profound, not less. How do
you think a 68040 would do, considering they removed bus-sizing logic?

: Kinda like the way the lack of abundant I/O features and speed on the Amiga
: 1200 can be "fixed" with an upgrade.

But the point at which our chip ram becomes as much a burden as your own
is further away.

: And adds full pre-emptive multitasking with MEMORY PROTECTION.

So do some of the most ugly unix-like system. While good features, it
doesn't correct the faults.

: And this is a technically advanced, object-oriented, refined multitasking
: system that WON'T LET YOU MOVE A WINDOW WHEREVER YOU WANT IT.
: This is hilarious!

I often wonder what sense there is in moving a window partially
offscreen. Its not in the least bit intuitive, taking it from a physical
kind of reasoning. You don't rest your folders with a single corner on

yoru desk. You've got a certain amount of physical space, and a certain amount of things you can do with it. Moving windows offscreen doesn't make a whole lot of sense--I don't like it on any system I've ever used, and this isn't a time where I care to have it.

Besides, MultiTOS is a technically advanced, refined OS that WON'T LET YOU USE MORE THAN ONE SCREEN??? Even X has this with Rooms, Windows has a primitive one too.

The existence of Public Screens greatly reduces the need for such things.

: Now, I was trying to be nice and assume that by now, this had changed on the
: Amiga. But, you mean to tell me that an ability every machine with a GUI
: worthy of that name has, is not available on the vaunted AGA equipped machines?

Like I said, I don't think its needed. When I get cluttered, I start grouping things. I've got all of my TeX stuff on my TeXBench screen, my C/Programming stuff and a shell open on my CodeBench screen. As a result, I've got Terminus on my workbench with a clock and a beta of PrintManager. Not very cluttered. Why? Because I group my applications based upon function, which is a logical thing to do. Everything in its place, a place for everything.

: Shared libraries on a machine that could have had SCSI-2 but now has just
: IDE. The speed bottleneck appears miraculously. :)

Ya, sure.

: Because you lack memory protection. :)

Because its a hell of a lot faster.

: Guess how CPXes get work done? Something very similar to callbacks under
: Motif.

Ahh, you mentioned the magic word, Motif...

: Now why would local cable compaines be stuck with 1.3? Didn't they follow
: the upgrade path and buy that new Amiga 1200 or 4000?

No. Prevue guide isn't updated often, and it wasn't rewritten and tested until recently. They simply didn't bother, because they simply didn't see much of a need. When the time came that they wanted a more advanced system, they rewrote it to its current setup; which is much nicer.

: Yes, and the Jaguar console system is the solution to the Sega CD and
: SuperNES. RSN should be translated as "Really? Show it Now." in regards
: to both companies. :)

Depending on who you're talking to, some have seen it. Yes, agreed, though.

: For how much cost? and where do you put it? in the one slot?

A SCSI system could go either onto a multifunciton card for the trapdoor,
a card on its own in the trapdoor, or... as a PCMCIA card.

: One of them. :) And once you occupy it, what then?

On the 1200? You've got two: You either use the trapdoor for your
stuff, or you stick something into the PCMCIA.

: (if you've got the money, upgrade your A1200 to be like a Falcon)

But because of the architectural flaws, you could never upgrade the
Falcon to be like an Amiga.

: What you do is just stupid, you don't know anything about the Atari
: software market, hence you try to convince Atari users there is more

Considering I owned one, I sure would hope I do. Considering I still have friends who use them, considering I went looking at a Falcon not so long ago, I disagree. I've got a pretty good idea of the size of the Falcon's software support, and I simply disagree.

: talking of application, the Amiga falls back somewhat...and compared
: to the PC or Apple market, your statement is completely ridicolous.

Where did I mention them? The comparison is directly between the Amiga and the Falcon's software support. And the Amiga's, as not more than a few could tell you, is a great deal better. We've actually got many packages that are going multi-platform, and we've got a lot of multi-platform stuff moving to the Amiga.

: I am sure you have interviewed 'the industry' or have at least read some
: interviews in a trustable magazine.

I work at the school library, pal; I read more magazines than I can shake a stick at. Believe me, I've tried. At least 4 Atari magazines, 2 Amiga magazines ( I really don't much like Amiga magazines ), and several trade rags in both the computer and EE industry.

: I still do not know if I should laugh or cry. You are listing 7(!)
: companies, as if it was a proof that there are more developers for
: the Amiga. I could as easily list 10 companies, but who cares?

No, just an example of the multi-platform companies that are developing for the Amiga. That's not even a GOOD cross-section of the whole of the development community.

: The 'number of hardware demons' does not count, products do.

Yes.

: And there ARE more products for the Amiga, if you read the ads, but
: most hardware extensions are Z2/3 cards, how do you put them into
: the A1200?

Most hardware extensions are Z2, yes. And you'll inevitably see two things: 1) Expansion chassis that add the necessary logic to implement a Zorro 2/3 bus through the bottom expansion ports, and 2) a flurry of re-releases of hardware available in both A500/A600 trapdoor and Z2 stuff

on PCMCIA and A1200-trapdoor formats.

: of those? Nope, surely not. Once again: you have no idea what these
: OSes behave like when you are using them. You are judging from screen

Ya. Nice try. I've got a good bit of information on programming Windows
_AND_ OS/2. I've gone through developers stuff on the Falcon. I think
I've got a pretty good say.

: shots, following the line 'more colours - better OS', yes OS/2 is
: good, OS 3.0 is good, and MultiTOS is good - even if the speed
: problems have not been fixed yet.

MultiTOS isn't just a speed problem. MultiTOS is a lot more. And OS/2
_IS_ good, in both capability and API, and your lack of credit shows just
how little you know. If I ever, ever, EVER left the Amiga, it would be
for OS/2 or NeXTStep, or it would be for a freely-redistributable OS like
Sprite.

: Seems you are not trying to write this screen mode file, eh? Sorry for
: that, I am sure any A1200/4000 user was looking forward to it.

I won't need to.

: Stop! Even standard SCSI drives are better than IDE drives, don't you
: even know THAT? And using old IDE in his A4000 resulted in data loss

Well, depending on how you do it. If you're using polled I/O, you might
as well use IDE. But yes, a good DMA SCSI is worlds better than IDE.

: It doesn't simply NOT COME with the A1200, it WON'T FIT into it!!!!!

What does that mean? Yes, it doesn't fit. And? If I was to buy a 1200,
I _CERTAINLY_ wouldn't keep it in that case, I'd get an expansion
system. You know, kind of like your VME-system.

: Yes, and once again, prove me wrong!

I don't need to. Go out and pick up A/C's guide to the Amiga, I'm pretty
sure that should cover most bases.

Greg

I agree with 1) and 2), at least in America. There is far more Amiga support
here than there is ST support. And using older ST s/w will only benefit from
the graphics modes and improved speed of the Falcon, but not the DSP or
some of the other "newer" features.

>: And of course, we both know the Mac and DOS markets are so huge they have

Sure. But how much does Gigamem cost? Is it fast? Just because the product
exists doesn't mean it is good, usable, or stable.

>: having a fast hard disk is non-essential. So you use IDE. But you and I
>
>You could. Or, you could just go out and buy it.

I remember when someone in comp.sys.amiga.advocacy flamed me for saying that
if I wanted 32 bit CPU access to RAM, I'd just go buy a 3rd party board
and they said... "Sure, throw money at the problem... we have it standard...
nyaaah nyaaah". heheeheheh

So, in that same vein, how much will that cost? :)

Well then, considering the differences in the intended markets, does it not
seem reasonable that the two companies aimed their designs for users with
particular needs? And hence, the tradeoffs made were (probably) considered
beforehand?

From what I've heard (not sure if this is true or not) the choice of an
A24/D16 slot on the Falcon was because it would make the conversion of
Mega buss and STe/TT Vme cards easier.

However, like you said, the standard I/O on the Falcon is just fine. And
extremely flexible.

You seem to forget that (according to the flamers) the only flaw in the Falcon
is the CPU's 16-bit access to the 14MB of RAM accessible to its chipset.

This chipset, which comprises the DSP, mouse/joystick/keyboard I/O, networking,
etc... can do 32-bit access to RAM.

>: But as any good engineer would tell you, there are tradeoffs made. Atari chose

I agree. But considering the intended market, the price of the base model,
and the on-board capabilities, it is definitely satifactory.

The "perfect" Falcon might have included a 68040, better case design with
detachable keyboard, several expansion slots, and onboard provisions for
FastRAM w/o relying on 3rd party products.

I surely would not have minded seeing multiple DSPs (96001s?) :)

Just out of curiosity, then, how does the 68040 Amiga run any better if it
has the same, identical, problem?

Also, what is your source for the claim that the removed the bus-sizing
logic?

(or perhaps I have overlooked something obvious?)

>: Kinda like the way the lack of abundant I/O features and speed on the Amiga
>: 1200 can be "fixed" with an upgrade.

And what is this supposed to mean? Granted, your CPU can access chip RAM
32 bits at a time, and this is an advantage. But also, consider that the
Falcon can have up to 14MB of "chip RAM". That means greater space for
things like digitized sound to be cached as it is pumped in from the SCSI-2
and cached in RAM before being fed to the 4-channel DMA sound system.

>: And adds full pre-emptive multitasking with MEMORY PROTECTION.
>
>So do some of the most ugly unix-like system. While good features, it
>doesn't correct the faults.

Nope. But it removes the problems associated with rampant programs corrupting
the space occupied by others. One thing I should clarify is that MultiTOS
(and MiNT) don't offer memory protection on 68000 machines, either, but it
is there on 68030 machines.

>and this isn't a time where I care to have it.

Ok, well, that's YOUR opinion. Sometimes, I like to just move a window off
to the edge rather than close it so I can have quicker and easier access to
it. It can also help you "unclutter" your desktop... so you can work with
more applications at one time without having to have them all in your field
of vision or having to constantly resize them.

>
>Besides, MultiTOS is a technically advanced, refined OS that WON'T LET
>YOU USE MORE THAN ONE SCREEN??? Even X has this with Rooms, Windows has
>a primitive one too.

What's to stop a program under MultiTOS from writing to a private "screen"
and using that when the user wishes to interact with that application?

>
>The existence of Public Screens greatly reduces the need for such things.
>

>Optional joystick ports... i.e., the ones you can use when two more friends
>drop by if the game supports it.
>
>The ones you can also make double as I/O ports for other devices. Surely you
>have seen various types of devices designed for such purposes, ranging from
>dinky sound samplers to input devices like touch tablets, etc...

Hehe.. on the Amiga, thats called a "parallel" port. Ok, granted, its kinda
neat to have specialized ports for that on the Falcon. But I'm
wondering what makes this much more important than a 32-bit data path to
custom chip memory?

>Another set of ports I'd like to add to the Falcon's list are the stereo
>IN and OUT. Sure, the Ami has stereo out. But in? Yes, that means we
>can sample out the box with the Falcon. Just add s/w, no h/w required. :)

Neat.. I guess I don't find this as useful as some people, tho. :-) TO
each his own.

>But it may be because the engineers at C= decided that to best serve their
>intended market, they didn't want to add those items' cost to the machine,
>but did add the cost of wiring the CPU up for 32-bit access. A tradeoff
>some people will appreciate and others will barf at. It's subjective.
>(A point a lot of people can't fully understand, I guess)

Yeah, subjective, esp. since neither you nor I have ANY idea what C='s
engineers were thinking. Pointless to speculate on it.

>>And, oh yes, as pointed out here many times, some PC OS's have VM... and
>>it works fine on an IDE drive.
>
>Yes, they do. But won't they work faster on a higher speed and higher capacity

>DSP, so you can knock out yet another big factor in application performance.

Depends on the application, and floppy speed has nothing to do with HD
speed. But I'll agree that the Falcon has a tons more custom dodad's on
it. :-)

>>>And adds full pre-emptive multitasking with MEMORY PROTECTION.
>>>And it treats all devices as UNIX would, and even processes are handled

We certainly do.. dare I say, MORE options in this regard than you do.
:-)

>>>And this is a technically advanced, object-oriented, refined multitasking
>>>system that WON'T LET YOU MOVE A WINDOW WHEREVER YOU WANT IT.
>>>This is hilarious!
>>
>>Oh, and I suppose I could say the same thing about the UNIX-like
>>technically advanced MultiTOS locking up during disk drive accesses, but
>>that would have nothing to do with the API now would it?

>>
>I'm running MiNT now. It never locks up during a HD access. Only floppy
>disk.

Thats what I was talking about. ie. Its just as relavent to normal
operation (not at all).

>>Its not a matter of "let", its a matter of support. It possible to
>>implement (if you can do overlapping windows, you can surely do that),
>
>Yeah, right. Well, if it is so easy to implement, why has Commodore not
>included it in any of the OS revisions? After all, if they can have
>shared libraries, RTG, and all these deep, meaningful features, and they
>can change resolution on a single scanline thanks to Copperlists and such,
>why can't a window be moved to the edge of the screen and be clipped?
>Hmmmmmmmmm?

Perhaps they found the other stuff more important than dragging stuff
partially offscreen? Perhaps it has something to do with the fact that
the Amiga can have more than one GUI screen? Perhaps it has to do with
teh fact that C= can sometimes be a little brain dead? :-)

>TOS does it. MS Windows does it. Macintosh does it. Every window
>manager I've used under UNIX (twm, mwm, olwm) can do it. But Amiga? No. :)

None of these uses screens (that I'm aware of), I guess that isn't
useful then? NOT!! This is a non-argument.

>>utilities and their ilk, but not one utility that added this function.
>>Hum, you'd think it wasn't so very important wouldn't you?
>Well, hey, I guess it isn't. :)
>But then, I guess you've never opened up a lot of windows, eh?

Oh I have, it's just unlike some people, I actually iconfiy or
minaturize windows that I'm not using instead of having fifteen hundred
full size windows open at once. I'd like to know why there is such a
radical difference between dragging a window partially offscreen (so
that you can't see its contents ANYWAY) and iconifying it?

Fact is, its really personal preference, and this argument is pointless
anyway. But this is csa.advocacy, right? :-)

>>Are you telling us that the ability to clip windows offscreen tells you
>>something about the API of a GUI? heh... time to write that one down.
>
>Well, it's kind of like leaving out the bread-'n-butter of a GUI.
>You know.. the ability to MOVE (gasp!) a window!

Er, no.. it's kinda like deceiving yourself. Of course AmigaDOS can
*move* a window. geesh. :-)

>>Its been done for 7 years, and its still done. Its not slow on even
>>floppies, really. If you knew WTH you were talking about, you'd know
>>this.

>
>Well, let me give you an example.
>A friend of mine boots up on his A500 from floppy to use the modem. He
>has no hard drive.
>It takes 2 minutes for him to load up and get Baud Bandit up and running.

He's doing something wrong, its that simple. It took me about 40 secs
to load up VLT on a floppy only system. Again, subjective as hell. ANd
anyway I wasn't really refering to this.

>Now what you're saying is that the next generation of Amiga (the AGA
>machines) run adequately off floppy.

Never said that. What I meant to say is that shared libs do not really
incurr that much of a penalty on a floppy system. They do, for sure,
just not as much as you seem to imply. You were saying that an IDE
system would seem inferior to SCSI2 because of the loading time of
shared libs?? Thats just totally offbase.

>I'm sarcastically gonna say... "suuuuuuuuuuuuuuuure!"

hehe.. exactly.

>>>>efficiency. Lightning-quick message passing system based on passing
>>>>pointers rather than the unixy-method of passing blocks of memory.
>>>^^^^^^^^^
>>>Because you lack memory protection. :)
>>No, actually its much the reverse.
>Since when did every Amiga have memory protection? Did we all miss the
>sudden appearance of 68851s in all 68020 Amigas? :)

I didn't say that, I said "reverse". ie. Amigas don't have memory
protection because exec uses short cuts to make things operate faster.
Exec doesn't take short cuts because memory protection wasn't there. Ya
know, the ole' tradeoff? :-)

>Wow! About the same time! Gee whiz, Batman, I'd never have figured that out!
>My point is that there is no big deal to callbacks..they can be implemented
>on any system with ease.
>Hell, if I can do it in assembler with no effort, anyone can. :)

Point taken. :-)

>>>For how much cost? and where do you put it? in the one slot?
>>
>>Yes, the one slot. Remember that we also have an A4000, unlike Atari
>>which only seemed to release the lowend/hack system.
>

True. :-)

>However, to a serious workstation user, the Amiga line probably compares
>pretty poorly to, say, a SGI, wouldn't it? :) A typical SGI owner may
>think "Gee, when is C= going to stop making game machines?".... :)

Who's comparing Amiga's to SGI's?

>>No, more than that. You see, if you want expansion, you can get an
>>A4000. As you said, its all about trade-offs.
>>
>
>The A4000 which costs a lot more, you should add. :)

Yup, about the same as a Falcon with a '40 board added, or with real
32-bit mem and a sizable HD added. :-)

>Considering the tone of this post, I can see why the turtle was dry. :)

heh.

I'm still waiting for the name of the SCSI-Controller and the
specs of the DMA engine.....i'm sure you know the crippled old
ST SCSI-Port(countless articles in the CT about how to cludge
that SCSI-Port). I would prefer a fast cheap IDE to a slow
possible crippled SCSI-Port.(And yes i use a Zorro3 SCS-Fast controller
in my A4000 because *I* need it. Several friends don't need a SCSI
because they only have 1 disk.)

(schnipp...my own boring comments)

>Yes, the A1200 is a good computer (esp. for games), but it is in NO WAY
>comparable to the Falcon, that's the problem. The Falcon suffers from
>16bit RAM access from the processor, but it comes with lots of features

>are unable to accept.

I don't think somebody compares the A1200 to the Falcon and that
everybody is aware of the additional Networkport and DSP.
The truth is that almost nobody here cares for the machine.....
Personally i can't see any sense in buying a Falcon if you're not
into midi stuff and doesn't care for a company that is already
buried alive. Sorry for this little polemic but if you look how
long it took Atari to release the Falcon, how hard it is to
find dealers that sell Ataris and the closing of several Atari
subcompanies in europe(swiss,scandinavia and probably more)
it's obvious that this company has not enough money. I'm still
wondering why the Tramiel family still run this company and not
sell the rest.
(Yes i know..CBM is also in trouble but at least they sell machines.
Can you tell that about Atari ? Don't think so.)

In article <20kqmv$rpo@cville-srv.wam.umd.edu>, 'Flip' Medley (cmedley@wam.umd.edu) wrote:
: And one thing to remember is that Amiga and ST/Falcon sales are also dependant
: upon how well these machines can compete against the clones and the Mac.

Which really says nothing about a discussion which asks the question of
which of the two has the greater amount of software support, the answer
to which I believe is the Amiga.

: Sure. But how much does Gigamem cost? Is it fast? Just because the product
: exists doesn't mean it is good, usable, or stable.

Good, usable, and stable it is. Cheap, I think you can pick it up for
about a hundred bucks.

: So, in that same vein, how much will that cost? :)

Well, there's a 1200 SCSI/RAM/FPU board here for 499 with 4 megs of fast,
a 33MHz FPU, and SCSI-I. (Just a quick peek in an ad.)

: Well then, considering the differences in the intended markets, does it not
: seem reasonable that the two companies aimed their designs for users with
: particular needs? And hence, the tradeoffs made were (probably) considered
: beforehand?

Does that mean we should just overlook them? I hope not, because I don't
believe so. I gave Apple no slack for the crippling of their systems,
and regardless of popularity, or lack thereof, I give none to Atari.

: From what I've heard (not sure if this is true or not) the choice of an
: A24/D16 slot on the Falcon was because it would make the conversion of
: Mega buss and STe/TT Vme cards easier.

I'm sure it will. Again, a tradeoff, but one that crippled their system
because of their insistence on backwards-compatibility, which I'm not
altogether sure they should have kept. I'm also not altogether sure they
had much of a choice, but...

: However, like you said, the standard I/O on the Falcon is just fine. And
: extremely flexible.

Until you start upgrading. And then you'll feel the pinch of that
architecture.

: It's been in every Mega STe, TT, and Falcon as standard gear. :)

Network support isn't built into our OS yet, so it wouldn't mean
anything. Yet. Envoy is due real soon now, though.

: You seem to forget that (according to the flamers) the only flaw in the Falcon
: is the CPU's 16-bit access to the 14MB of RAM accessible to its chipset.

Umm, that's not the only flaw. That was part of my point.

: I agree. But considering the intended market, the price of the base model,
: and the on-board capabilities, it is definitely satifactory.

No amount of cost should allow a manufacturer to cripple an architecture
at a whim. The Falcon looks like they designed the system with a 68000
in mind, and dropped in a 68030 after the fact.

: Just out of curiosity, then, how does the 68040 Amiga run any better if it
: has the same, identical, problem?

It doesn't. New Amiga systems are fully 32-bit, so you don't need the
bus sizing logic. Old amiga systems had the logic externally--and
suffered because of it.

Also, because of the way the 68040 fetches, having a 16-bit path will
drop things TREMENDOUSLY. Because the 68040 fetches more than you ask it
to, automatically.

: Also, what is your source for the claim that the removed the bus-sizing
: logic?

Common knowledge about the 68040.

: (or perhaps I have overlooked something obvious?)

The lack of it on-chip doesn't mean you can't do it.

: And what is this supposed to mean? Granted, your CPU can access chip RAM
: 32 bits at a time, and this is an advantage. But also, consider that the

BIG advantage, especially when you go 68040, +.

: Falcon can have up to 14MB of "chip RAM". That means greater space for
: things like digitized sound to be cached as it is pumped in from the SCSI-2
: and cached in RAM before being fed to the 4-channel DMA sound system.

All of which is accessed by the 030 slowly, and by an 040 at a big
penalty due to the way it pulls in full cache lines of data.

: Nope. But it removes the problems associated with rampant programs corrupting
: the space occupied by others. One thing I should clarify is that MultiTOS
: (and MiNT) don't offer memory protection on 68000 machines, either, but it
: is there on 68030 machines.

Of course.

: Ok, well, that's YOUR opinion. Sometimes, I like to just move a window off
: to the edge rather than close it so I can have quicker and easier access to

Oh, I don't like to close them either. I either iconify them, or shrink
them down to nothing more than a menu bar, which is just as fast. Just
an example of how there are other ways to do what gives you the same

effect.

: it. It can also help you "unclutter" your desktop... so you can work with
: more applications at one time without having to have them all in your field
: of vision or having to constantly resize them.

Grouping applications by task yields efficiency. I run all of my TeX
stuff on a screen of its own--when I work with TeX, all of my
applications are there for me, waiting; there's nothing else there to get
in my way. Grouping applications makes sense.

: What's to stop a program under MultiTOS from writing to a private "screen"
: and using that when the user wishes to interact with that application?

Is there OS support for it? Can you? No. Sure, you could add it.

But then again, I could add support for dragging windows offscreen, and
it wouldn't be impossible. Just some OS extension, something that's
quite easy to do.

: Great philosophy. But don't you wonder why it can't do something every other
: platform can do?

Nothing's stopping it, if I wanted it to. I don't have a need for it,
I've got other ways of having the same effect without moving the
applications I want and need offscreen. Grouping applications,
iconifying to either icons or title bars, depth arrangement. All of
those things can be a better replacement.

: (shows how in touch with the industry they are, i guess, eh?)

Shows how many GUI lemmings there are out there, I guess. We may see it,
who knows--the Amiga GUI is looking more and more like Motif as time
passes.

: Why add a card when you can have it standard, eh?

Because some people need nothing more than an IDE drive.

: PCMCIA is 16-bit isn't it?

Yup. Which is okay, considering what SCSI-I is... but it's not great.
For many cases, its fine.

: (the bad thing is, I may one day own one... heheehheehe)

Maybe then you'll change your tune, who knows.

Greg

If everyone bought their computer this way, Commodore AND Atari wouldn't even exist. We'd all have Macs or clones.

} : >The software support for the Amiga is several times better than that of
} : >the Falcon, [...]
}
} : Sure it is.
}
} It is, simply put. Ever hear of Comeau C++? Its a multi-platform C++
} made for many types of workstations. AND the Amiga.

Comeau C++ is also available (or will be in a small number of weeks
time) on the ST range. This is from (is it Greg) Comeau himself on
c.s.a.st. Not to mention g++ (which I expect is also available on the
amiga) which is probably more cross-range than anything else.

} Ever hear of SAS? SAS makes some of the most widely-known products in
} the industry, in general. They also do our, and others', most popular C
} compiler, SAS/C.

I'd say the most popular C compiler is gcc on the ST (for those with
a hard drive), though Lattice C and PureC have strong followings.

} Electronic Arts, perhaps, of the popular DeluxePaint fame. We won't even
} get into that.

I don't feel qualified to comment on this - I'd use a silicon graphics
machine for graphics, and nothing less.

} You may or may not know Blue Ribbon Soundworks... Bars & Pipes
} Professional?

Again, I'm not really into sound stuff on the ST.

} Ever hear of NewTek? Nah.

Nope. What do they do ?

} Those are just a few names that you might recognize--not because they're
} popular Amiga developers, but because they're known across the industry
} for the products they make.
}
} Then of course, theres prevalent Amiga developers like GVP, Black Belt,
} Centaur, SunRize, ReadySoft, Digital Creations, ASDG, and a GREAT deal
} more. There is a disparate difference between the state of the Amiga's

} software development and that of the Falcon/Atari.

Agreed. I think there're more C= developers around as well, but then thats a function of the machines popularity, which is variable. There is the traditional chicken/egg situation for anything new, but I don't expect that to be a problem for anything new for either C= or Atari; so long as they provide a (limited?) version of any program which works on older machines they'll be ok. As the new machines mature they can drop the limited versions.

} So, yes, "better software support". And hardware as well--we've got more
} than just a few hardware demons, including the legendary GVP (well,
} they're legendary on the Amiga because they've been around for eons).

Since hardware is being argued bitterly in several other threads, I'll leave this out...

As far as operating systems go, MultiTos is technically pretty good:

o It's multi-user, multi-tasking, multi-threading.
o It offers memory protection for all programs.
o It offers loadable filesystems at boot time. Simply put a *.xfs file in the /mint directory and you have a new fs type on which all the operating system calls work. I run with minix.xfs (a unix-alike fs, with symlinks, long names in dIfFeReNt case etc.), and ydisk.xfs - a compressing ramdisk.
o The kernel level stuff has a huge number of non-atari people working on updating libraries (and hence the kernel itself). By huge I mean hundreds. The Mint mailing list allows anyone to make contributions, criticisms etc. To give an idea of the traffic, message 190 in my MiNT mail folder (when shared libs were first mentioned) was March 31 '93. I'm now up to 338.
o It will (in the very near future) offer shared libs. The C= version was rejected as unsuitable as the binding to the library is via fixed function pointer tables and no automagical data creation exists. This isn't my opinion, it's from Alex Kiernan, of Lattice C fame. I originally put forward the be-compatible-with-the-amiga idea. The reason we're not following the Linux format is because that would restrict shared libs to 030+ machines.
o Work is also underway to develop non-blocking SCSI/ACSI/IDE devices with a generic disk interface above and the filesystems above that. This is because a lot of the real performance-problems with MiNT/MultiTOS is io-related. The perceived performance of Multi-TOS is worse than it could be because the desktop runs in supervisor mode. This is being changed, at which point the system ought to give itself a hell of a boost. MiNT/MultiTOS doesn't interrupt supervisor -level processes.

The API will improve in time, I don't think it's fair to criticise a new interface for having tools which aren't as good as an older interface. Working in the PureC environment is apparently already very nice (hypertext help + all the resource stuff).

This started out as being a short "we've got that as well". Ah well.

Simon.

With all this talk about Falcon vs A1200, I'm wondering how much the systems cost. Even though Commodore is slow as molassas to release DSP boards, an A1200 with 68030 (full 32-bit) and SCSI-2 must be about $1000. Of course, the Falcon's got the MIDI and sampling features, too; presumably, a DSP for the A1200 would add this stuff.

Anyway, I'd take a nice Toyota Supra Turbo over either one. :-) I've been following the car market more since I got my new wheels. I have to start planning for my next purchase... in about five years. I like the style of the Dodge Stealth RT/Turbo, but the '95 model loses that style. The Dodge Viper GTS makes up for the loss, so maybe I'll get that instead. :-) Am I the only one who thinks for Ford Probe needs a rear spoiler to give it some flare? Even the '95 Mustangs are getting that amorphous look.

I just may pick up a new computer while I decide important stuff. I need to see some better pricing and goals from Commodore. Come on--a 68EC020 machine with IDE and no drive should sell for no more than $300. The A4000 shouldn't have IDE at all. From Atari I'd like to see some indication that they are moving into the mainstream of home computers, again. Mostly likely I'd end up buying a Pentium system, but this decision will probably take another year.

-> From a fast, efficient, IDE disk. hehehe

Stop write anything ! >;-(

Write us disk performances of a scsi-2 equipped ATARI FALCON !!!!

I've do a test on my A1200 IDE/MAXTOR/120Megs hd :

DiskPerf2. Testing Travail:

Create Files: 45 files/sec. Directory Scan: 188 entries/sec.
Delete Files: 147 files/sec. Seek/Read Test: 255 seek/sec.

Read/Write Speed Test: (bytes/sec.)

Buffer: 512 Read: 109,500 Write: 21,396
Buffer: 4k Read: 391,844 Write: 145,473
Buffer: 8k Read: 395,390 Write: 281,875
Buffer: 32k Read: 463,971 Write: 422,812
Buffer: 64k Read: 495,546 Write: 455,902
Buffer: 256k Read: 512,000 Write: 474,898

You said that IDE on A1200 was insufficient to take advantages of shared
library, in regards of speed. Can you explain what kind (numbers please)
of performances are needed, minimally ?

Bye!!

>;-]

It depends on the HD. I'm sure your A500 HD was a LPS52/105 and
should be able to get almost the same performance with the AT/IDE.
BTW...i remember that Skip Sauls tried a faster Secrate and got
about 1400kb/s.

>About what perfs you think that i will do WITH fast memory ?

Mhhh...with that HD probably 900kb/s. You should really get
Fastram because it will speed up your A1200 approx. 2x

Regards..

SAS/C _is_ Lattice C. There's also DICE (shareware & soon to be
commercial), PDC (an old freely distributable compiler), and Aztec C
(although the latter two are apparently no longer updated). There's also
the GNU stuff and a C++ compiler that's coming out from some German company
whose name I can't remember.
Other languages I can think of right off hand are HiSoft Pascal, one or
two Modula-2 compilers, AMOS, AmigaE, and others.

>>Electronic Arts, perhaps, of the popular DeluxePaint fame. We won't even
>>get into that.
>
>Try PixArt, Papillion or True Paint.

I believe there is/was a program called True Paint for one of the early
Amiga 24-bit boards. DPaint is so good that most other paint programs for
the standard chip set have fallen by the wayside. For owners of more
specialized hardware there are things like TVPaint, DCTVPaint, etc.
Of course, Brilliance is coming RSN, and should really give DPaint
a challenge.

> Is there also a good vector graphics
>programm on the Amiga like XAct, Outline Art or DA's Vektor? Do they have

Pro Draw, Pro Vector, Art Expressions. None of them are Corel Draw,
but they've finally reached the point of being not half bad :)

>semi-professional photostyling software?

As in image processing? ADPro, ImageMaster, ImageFX.

> Do they have a professional DTP
>software (like Calamus SL or Didot Professional)? Are there even some worthy

PageStream 2.2x (with capabilities like HotLinks, which aren't planned
for the Atari), ProPage, Saxon Publisher.
PageStream 3.0, due out this summer for the Amiga (no word yet on the
Atari version) is a major rewrite that will supposedly "add more features than
the last version had to begin with" (as is more than doubling the feature list).
While this sounds like advertising hype, I saw an early version of PgS 3.0
demoed at a trade show and it was _very_ impressive.

>wordprocessors on the Amiga?

Depends on how you define 'worthy'. There's no Ami Pro, MS Word, or
WordPerfect 6 caliber WP, but ProWrite and Final Copy are decent.

>>You may or may not know Blue Ribbon Soundworks... Bars & Pipes
>>Professional?
>
>Finally there is one sequenzer for the Amiga you can work with. Wow!
>Better try Cubase, Notator, Live or Star Track (and many more sequenzers

Don't know much about music software, but I'll agree that the ST has
a definite advantage in the MIDI area. I do know that EA is close to
releasing Deluxe Music Construction Set II, which is supposed to be a very
reasonable program :)

How about some other areas? Do the Falcon/ST have any good 3D graphics
software like Real3D 2, Aladdin4D, LightWave (with Toaster dongle :), and
probably 20+ other programs & utilities related to 3D rendering?
What about morphing software? Not exactly a huge market, but fun to play
around with and available in at least 5 different packages for the Ami.
Any good comm software? We've got Term, JR-Comm, VLT, and soon Terminus,
all very good PD or shareware. Do you have cool PD/shareware utilities like
ToolManager, ReOrg, DiskSalv (thanks, Dave!), etc.,... all of very professional
quality but freely redistributable or low-cost shareware? Do you have an
equivalent to the nearly 900-disk Fred Fish collection of freely distributable
software (which despite its size makes up a fairly small portion of the Amiga
PD software market)?

(... much software comparison stuff deleted ...)

Hhmm, this long-lasting, brutal discussion between the Amiga and the
Atari users ... I thought this was finished two or three years ago.

The main point in this discussion:
(I must mention first that I'm decidated to the Amiga.)

There is actually very good application stuff on Atari.
The problem of the US guys is the fact that more than 99% of Atari
software is being made in Europe, or to be more precise: Nearly all of it in
Germany.
For example, if a pro-Amiga advocator from US writes there was no good Atari
stuff (and that B&P 2.0 was the best sequencer ever), well, how can he know
if he had never seen an Atari or the software running on it.
I personally got a lot of friends which use(d) an Atari and they have some
very excellent software (especially midi-stuff -> "Steinberg").

For an overwiew, take this:
In the times after 1986, when the competition between Amiga, Mac,
PC and Atari started, the following happened:

America: - PC became industrial standard, nearly all used standard
applications come from here. Today also leading game machine.
- Mac is 'the better choice' with many conversions, strong in
DTP, Midi and other high-standard applications. More games
available as in Germany.
- Amiga was a pure game machine first, but is nowadays outpriced
by the PC and many game companies stop developping.
Strong niche market in Desktop Video and Studios.
- Atari - well, I think there was always not much more of Atari in
America than the headquarter.

Germany: - PC became industrial standard, too. More than 95% of the
commercial applications come from America in German versions.
Very strong in the game market.
- Mac has not such a strong position like in America. The machines
are (were ?) just too expansive for home users.
Good postion in DTP and other publishing. Very few games.
- Amiga became the official new machine replacing the C64.
More than 1,5 Mio Amigas sold in Germany. Many external hardware

developments, especially graphic boards, come from here.
Applications both from here (from all over Europe) and America,
very strong position in Desktop Video and Studios, animation,
graphics, Multimedia.
Competing with the PC in the game market.
As many US companies stopped developping for Amiga, nearly all
conversions from PC games come from England.
- Atari: Due to the low price, the midi-ports and the flicker-free
display, many small German software companies which are nearly
not known to non-Atari users developed many very good applica-
tions in the categories midi, vectordrawing, databases, word-
processing and DTP. Today, the lack of new powerful Ataris (no
040 !) and the raid of Windows pushes the Atari out of business.
The game war was lost in '91 against the Amiga.
The Falcon could do very good Amiga/PC conversions, but there
not enough machines in the market to make it profitable.
Holds a small share in DTP and is still leading in midi.

My personnel conclusion:
^^^^^^^^^^^^^^^^^^^^^^^^
As an convinced Amiga user, I would be glad if I had Amiga conversions of
some great Atari applications (Signum! 3, ...).
But one thing is more important:
The Amiga will survive (I deeply hope), while no one can stop the Atari from
dying. Many of those small software companies dissolve or change the system,
mostly to Windows (ggrrrr.). Very few expand to Amiga (Maxon).
I would like to see more of this small companies to convert their products to
Amiga seeking for new markets. But they should do better than GFA with it's
Basic (brrr, horrible).

So my recommendation for Atari users (hehehe):
Wait for the Atari-module for Emplant being finished, then get an A4000.

My recommendation to US pro-Amiga advoctors:
Don't blame a machine and it's software which you dont't know.
Don't make statements like 'Oh, look our wonderful applications !'.
This may be true in the graphics sector, but in many areas like midi,
wordprocessing, databases, vectordrawing and many more is still a lot of
work to be done. I hope that PGS 3.0 will be as good as announced.

Waiting for RTG, CD-Rom, Networking, AAA, .....

Gary
A4000/40
(Uni Stuttgart)

Always remember - there's nothing better more - than the AMIGA

Maybe for some older version of WB, but I've never once locked up copying files
on anything after 1.3.

Okay, so we agree that Atari has a bunch of names developing for it that we
Amiga ites have never heard of, and vice versa. I imagine that tossing these
names around has nothing at all to do with software availability for the two
machines, or for software quality for that matter.

Perhaps a different tack would be in order.

What the hell is the problem with 'not being able to move a window off screen?' I hardly think this is an issue with any Amiga running the OS 2.04 or greater. For crying out loud, just increase the damn virtual screen size, its the same bloody thing. I can see a use for moving windows around a nice big virtual screen, but how the hell can you say it's a glaring _ERROR_ that the Ami can't? PLEASE EXPLAIN this logic, I fail to see.

"OOPS!! DAMN! Better sell my 4000T! I can't even move a window off screen! What junk!" -- Sheesh
Ok, maybe this is an exaggerated response, but you get the picture (I hope...)

Huh? I can't recall my 500 EVER locking up while copying files. Of course I've only had OS 1.3 and up. Surely you're not using AmigaOS 1.0 for your unfounded statement, are you?
Besides, why in the WORLD would you defend an OS, by saying "it never locks up during an HD access, only floppy disk" ?! That's _totally_ unacceptable, and if I had any OS with that bug, I'd toss it immediately.

## 731. Jaguar

Newsgroup: comp.sys.atari.advocacy
Date: 1993-06-29 05:25:15 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Jun29.052515.163969@zeus.calpoly.edu>
Source record: 22514

I havent been following this group, (much), but a few maybe new things:

At the recent stockholders meeting (Last friday), they showed the Jaguar and Falcon. The Jaguar is a 64 bit RISC based game machine. VERY nice. The first few titles they showed sucked. Tempest was of course cool, but not a very exciting visually game. A game called CyberMorph was excellent. It had real time polygon shaded surfaces that looked fairly good. The resolution is better than 640x400 (I dont have a real number, sorry) in 24 bit color. 16 bit sound (on board DSP, a chip also specially made by atari). The RISC chip took 3 years to develop. The system will be available November in SF and NY. Then December in London and Paris. Early 1994 for the rest. Cost: only about $200. Very cool system. I have faith that atari will fuck it up somehow (poor marketing), but the quality is better than anything out (including 3d0 which is about $700). The $200 is without CD. The CD is optional, and costs about $200.

Atari pretty much indicated it is essentially giving up on the PC market. (I.e. falcon is a music machine because of its DSP and MIDI. They feel it is a good computer, but don't plan to ever try to sell it in any significant number).

Well thats is.....

I have some written info on Jaguar, Falcon, and Lynx. Write to me at MDRAEGER@SCU.EDU if you want more info.

- mike

What about AMOS Basic, then? Why would Francois Lionet dump Atari for the more powerful and easier to program Amiga? Why is AMOS so much better than STOS?

Surely you jest. Final Copy II is an awesome word processor, with structured drawing abilities, all for around $60. Then there's Pro Page and Pagestream, the granddaddies of Amiga DTP. Ever look at the old _.info_ magazine? It was completely done on the Amiga with these packages, and it was a much better quality than most others.

Why not just one? We are using it at school to dub in the soundtrack to our Wavefront animations. We were told that there will soon be an SGI version, so, how does that sound for progress? Imagine that, Amiga apps ported to an SGI. :)

> >Eh? Weren't you on the planet when I was discussing the architectural
> >miscarriages in the Falcon?
>
> Well, discussed... but not proofed.

Jeezus! How much proof do you guys need?! Do I need to run SysInfo and AIBB on my 030 500 with 4 megs 32 bit RAM/3 megs 16 bit RAM, then disable the 32 bit RAM, and show y'all the results? It is quite simply, _unacceptable_. And it is foolish to argue which machine is faster, when one has ALL 32 bit access, and the other will ALWAYS have 16 bit access, no matter how much 32 bit RAM you add. I'd much rather have a 1200 than my half-breed 32 bit machine, which I dearly love.

It doesn't matter what kind of access your custom chips have, 16 or 32 bit. The computer won't run without the CPU, and if a full 32 bit CPU is forced to access thru a 16 bit bus, IT'S PERFORMANCE WILL SUFFER *SUBSTANTIALLY*! Understood?

According to SysInfo 3.15:

My 030 500 runs 8.07 times faster than it does with the 030 turned off, when it's using only 32 bit memory.
My 030 500 runs 1.47 times faster than it does with the 030 turned off, when it's forced to use memory thru the 16 bit bus.

That's not using ONLY 16 bit memory, but a combination of 16 and 32 bit memory. How in the world can you justify introducing a new modern system with performance possiblities like that?

I fully agree. Not only with 2.x can you use a huge (16kx16k) virtual,
smoothly scrolling workbench, but you can also "zip" up any window, by simply
clicking on that little gadget in the top right. So, any program that doesn't
have an "iconify" option, can be reduced to the smallest possible size, and
instantly zapped back up to size. Besides, using the PD commodity YAK, I can
instantly push a window to the back or pop it in front. Windows are rarely
a problem for me. (Also, it works the same way with screens.)

It's really pathetic to see Flip using this as a cornerstone to his argument
that Amigas suck compared to Ataris.

Let me ask you this. Who do you think the a1200 is aimed for? Folks who need huge, hi speed drives, networks, midi ports, etc. or people who aren't rich who want a good, all around computer, with fantastic graphics and OS, is easy to program, unsurpassed user support and loyalty, etc.

The wealthy Amigans buy a3000's or a4000's. We others buy what we can afford with all the performance we need. When the time comes, we can upgrade, and very inexpensively. Who can argue that the Amiga is probably the most expandable and powerful home computer to date? Even the 500, which was created as minimally-expandable, has tons of hardware to make it equal to the bigger guns of Amigaland.

It makes no sense to pack all kinds of hardware into a machine, raising the base price, when not everyone will have a use for it. Unless of course, there is no other model to choose from. C= has always released new machines in multiple configurations, which are 99% completely compatible. There is always a streamlined, affordable model, as well as a souped up dream machine, with the price tag to boot.
The Falcon however seems to be positioned at the novice<-->professional user. So what you have is users of limited ability, interest, use, etc. having to pay the same price as the midi-composers, networkers, etc.

And of course, as I and many others have said before, if you're gonna call your 030 computer a professional machine, why the hell would you give the CPU any 16 bit access at all? In 1993, with new machines being 32 bit only as a standard, that's absurd.

>

*Sigh* More Amiga is a games machine BS. "Suffers from 16 bit access" is
putting it a bit mildly, dont'cha think? I really wonder how the Falcon
would fare, it it was made in two versions. One without a lot of the
unnecessary interfaces and with the ridiculous bottleneck, and one that's
pretty much what the Falcon is, but with a 32 bit only bus. This thread would
be much more interesting, wouldn't it?

Where did I say that? I said 'A1200 is a games machine', this means stock
A1200s. And this IS true. Amiga users here say that the minimum of 3 megs
is needed to do something useful with the Amiga, not to mention a hard disk
(or do stock A1200 always have hard disks in the US?).

AMOS is one thing that doesn't exist for the ST line in that great quality.
FalcOS may compete with it, but we are not discussing RSN products here,
are we?

Uh-oh, don't compare Pagestream with Calamus, and don't compare either of the
two with Quark XPress. At least here in Germany Calamus is accepted as being
the best for low-cost professional DTP, see cooperations with Linotype-Hell,
Agfa etc.

> Depends on how you define 'worthy'. There's no Ami Pro, MS Word, or

Sure, but none of them competes with Signum!3, even if Atari users hate
Signum's non-GEM GUI.

This is the strong market for Amigas, as well as DTP and MIDI are strong
markets for the Atari.

Only one comm package - Connect, but this one beats all others for the Atari.
It's shareware (60,- DM (~35 US$)) and even supports the voice mode of a
well-known Modem that is illegal in Germany (but who cares what the Telekom
wants them not to plug in?) the ZyXel U1496(E)(+).

So you can open drawers, start programms while your amiga is copying Files?
Gosh my A4000 can't. Tell me the trick,please.
The only thing you can do is using already started programms: the wb is
locked !!!

>two Modula-2 compilers, AMOS, AmigaE, and others.

Not very much. For Atari there are Pure C, Lattice C, GNU C, Laser C (no longer
supported), Alcyon C (old Atari-C), Sozobon C (PD), Mark-Williams C (PD) and
more...
There is only one C++ available for the Atari platform right now (GNU C++),
perhaps you can try to beat Atari here :)
Pure Pascal, Maxon Pascal and ST Pascal+ can easily compete with Turbo Pascal.
Haenisch Modula II, SPC-Modula II, Megamax Modula II, TDI Modula II,
LPR Modula II (PD, a port von Wirth's Modula) and more...
GFA-Basic 4.0 (soon), Omikron Basic, Hisoft Basic, True Basic (no longer
supported) and others...
Other: STOS (soon FalcOS), Prospero Fortran, Forth (3 compilers), Salix Prolog,
Toy Prolog (PD), XLisp (PD), Simula ST, APL, Pearl (PD) and many more i can't
remind yet.

That's quite enough, hm?

> I believe there is/was a program called True Paint for one of the early

>a challenge.

On the graphics side, the Amiga has little advantages. That's because the
good old ST was a little weak with graphics and only a few old graphic
programms exist. But the Falcon will do better.

>> Do they have a professional DTP

I have meant _professional_ Publishers. Atari users can get PageStream (older
version, but that makes no great difference), Timeworks Publisher and
Publishing Partner Master as well. But these packages are semi-professional.

>>wordprocessors on the Amiga?
>
> Depends on how you define 'worthy'. There's no Ami Pro, MS Word, or
>WordPerfect 6 caliber WP, but ProWrite and Final Copy are decent.

I think here is the greatest lack of software on the Amiga. Nothing which
can compete with Tempus-Word or Signum!3.

> How about some other areas? Do the Falcon/ST have any good 3D graphics

>around with and available in at least 5 different packages for the Ami.

Here you are right. Amiga animation and rendering software is miles ahead
of the Atari pendants. On the Atari you can get the old Cyber-Series, new
Phase 4 package and some others like DA's Vektor, Raystarter, Inshape...

> Any good comm software? We've got Term, JR-Comm, VLT, and soon Terminus,

>software (which despite its size makes up a fairly small portion of the Amiga
>PD software market)?

Yes, yes, yes. The PD-Market is a great advantage of both platforms, the
Amiga and the Atari (Intel-Machines seem to be harder to program :). There are
two terminal programs (Shareware) still not beaten by commercial ones:
Rufus and Connect. There are lots of PD/Shareware-Utilities.

Result: Both platforms are equal. The Amiga has advantages with graphic-
software and games, the Atari with wordprocessing and Midisoftware.
Don't forget: You can also play games on the Atari or do wordprocessing with
your Amiga with little restrictions.

Ciao Heiko.

> What about AMOS Basic, then? Why would Francois Lionet dump Atari for the
>more powerful and easier to program Amiga? Why is AMOS so much better than
>STOS?

Because AMOS was updatet and STOS wasn't. Lionet has announced FalcOS, a
games-Basic for the Falcon, wait and see.
By the way: AMOS or STOS are inferior languages. Better try GFA-Basic or C.

> Surely you jest. Final Copy II is an awesome word processor, with structured

There are dozens of DTP and wordprocessing programms available for the Atari
(in germany) that will beat your programms. Believe me. I have seen all of
them. In this market segment you will have no chance with your Amiga, sorry.

>It doesn't matter what kind of access your custom chips have, 16 or 32 bit.
>The computer won't run without the CPU, and if a full 32 bit CPU is forced
>to access thru a 16 bit bus, IT'S PERFORMANCE WILL SUFFER *SUBSTANTIALLY*!
>Understood?

Hm. It will suffer, that's right. But substantially? No, it will not. Not
with a cache. And that has to be proofed first! How is the percentage of
memory fetches out of the cache? How many memory fetches are longwords?
And don't forget that a 68030 with 16 MHz is faster than a 68020 with 14MHz.
So which system is faster? Nobody will be able to answer this question
including you.

Ciao Heiko

You might wanna think over the importance of that when you hear that the
Atari platform's premier animation s/w (Phase-4) was ALSO ported to the SGI.

It's funny that we're all bragging that they are porting our s/w to other
platforms because that's usually a sign that the company is either:

a) looking for more money (nothing wrong with that)
b) doing a) because the current market is tiny and insignificant (something
wrong with that, for those who own the machine... :) )

Well I guess you missed my point then. :)

If you look at the "concerns" (have you noticed flames are always called
"concerns" when people try to flame on the sly?) raised about the Falcon,
we've seen some incredible nit-picky things like not being able to multitask
when doing a floppy access.

I was simply demonstrating how if you nitpick over what the Amiga can't do,
or doesn't have standard, it looks just as stupid.

And it was hardly the cornerstone of my argument. :) You missed about
10 information packed postings. Get thee back to thine newsreader. :)

## 743. Cost of A1200 & Falcon

>with the price tag to boot.

I always hear the excuse that Commodore made compromises in the A1200's
design to cut the price. So where is this price cut? Isn't the retail
price of the machine $699? This is for a 14MHz EC020, no harddrive, IDE,
NO CLOCK, low-density floppy drive, etc. I still think the A1200 is a
great machine, especially for expansion, but where is the savings? Next
thing you know, they'll leave off the serial port (not everyone has a
modem) and the parallel port (not everyone has a printer) and the RGB
port (use a TV) and the second gameport and the keypad... Whoops! I'm
giving them too many ideas.

> And of course, as I and many others have said before, if you're gonna call

Although I think that is correct, the Atari is no skeleton though.
For instance, Lattice C took its own path from a few versions back
and is quite successful on the Atari. Comeau C++ 3.0 With Templates
is about to be released for the Atari. And so on. I think it is
undisputable that the Amiga is better off than the Atari from the perspective,
but also I think any conclusions made from that fact w/o a context is
unclear.

I am not Gary, Craig, Gregg, George, or Ray (I've been called all of these,
and more... and worse ;-})..... I am Greg. Yes, the is correct. Well,
almost as Comeau C++ has not been officially released yet for the Atari.
One does has to also realize that Comeau C++ existed for some time before
we did the initial port for the Amiga. OTOH, it has been over two years
since that release. The Atari market is obviously smaller and hence our
finally getting around to it. This is not meant as a derogatory, just a
statement of fact. Actually, that we have ported to it is some
recognition of the Atari.

Not exactly free. Certainly that is not the decision used
by many to obtain their compilers. Comeau C++ is uncontestably
the most diversely ported commercial C++ anywhere. If g++ is
considered non-commercial (I'm not convinced it is), then it is uncontestably
the most diversely ported non-commercial C++ anywhere. We have
some 40 some-odd ports. I suspect g++ has more but honestly do not know.

I agree with you wnoleheartedly. As mentioned a few messages back,
I don't know what can be concluded from what has been presented thus far.

Actually, IBM just had a press release today that they will be manufacturing the Atari Jaguar for them ($500M contract) in their spiffy 1200acre facility in Charlotte, NC. IBM will be responsible for component sourcing, Q/A, packaging, and distribution. rich chong

As for the Pagemaker versions on the IBM and MAC platforms, there
is not much to brag about! I used the latest versions in a
business environment and they were OK at best, but NOT excellent.
They lack much of everything needed for true desktop publishing.
I used the old version of Calamus and it was more powerful than
the latest on the MAC. It was less then $100 dollars also!
Don`t cut it down until you have used them both. Calamus SL is a
MUCH better bang for the buck!
Lannie

> This thread is getting ridiculous.

Well... I'm sorry to say this... but actually he's right... The
WB *DO* lock up when doing stuff... On pre 3.0 it locks when you
`info' a file, and pre 2.0 it even locks up while launching an
application (only while loading thou, but anyway...). All WB's
up to 3.0 show you that cute little `hands-off-i'm-busy' pointer
while copying/... files. But it does *NOT* lock up the whole
system, it's just that the WorkBench is a single task, and one
task can only do one thing at the time... (I wish that C= would
make the WB multithreaded some day...).

But sure, the comparison "WB locks" <=> "Falcon locks" is
ridiculous... WB is just a front-end application! If you typed
``Copy DH1:Junk/#? RAM:'' in a shell, that shell would lock up
as well... The other tasks running would still run smoothly ;)

> including you.
>

Heiko,
The example I gave you was NOT done on an 020. It was done on my 25 mhz. 68030. Last time I checked, both of my caches were on. The way I see it, except for mine being faster than yours, I just "proofed" to you the the bottleneck in CPU speed. However, I realize that since your CPU is slower, the bottleneck won't be as obvious as it is with mine.
But consider this, GVP, CSA, and Microbotics already have inexpensive and powerful accelerator cards available, with up to 50 mhz 030's on them. The CSA 12-Guage also comes with a SCSI interface, 4 megs, and an 882, along with the 50 mhz. 030. Whose machine is better equipped to deal with that kind of speed? With the Falcon ALWAYS having 16 bit access, the answer is simple.

ONLY Amiga Makes It Possible...

Call CSA, they have a really nice SCSI interface, called the 12-Guage. As
an extra bonus, it comes with a 50 mhz. 030, 50 mhz. 882, and 4 megs of
32 bit RAM.

You could also check with Microbotics and GVP, since their SCSI interfaces
that they made for the 1200 seem to work quite well, too.

: The Amiga Workbench locks while copying files, so what?

Tutoring session: What's the difference between MiNT and the Workbench?

MiNT is the OS; Workbench is an application. AmigaDOS does not "lock up" when things are accessed. Two applications can be accessing a single disk drive at the same time; it preempts at the lowest levels of the system. Just a bit of knowledge, so that you know next time: AmigaDOS does not lock up in such situations. In fact, two or more read requests can be placed upon a filesystem-device, and they will be fulfilled as close to simultaneously as possible.

Just a little example of how little you actually know of what you're speaking of.

: Use GNU-C++ instead. It's free and is implemented on nearly every platform
: including Atari.

I have since reminded and remembered that Comeau makes applications for
the Atari as well.

Point aside, my example was not to list "bigger and better programs", as
some seem to have taken it--my point was to show that we have a great
deal more cross-platform support both coming from other platforms, as
well as going TO other platforms. Its not an example of the applications
themselves, but of the companies and the software support available ON
the Amiga in comparison to the Atari/Falcon realm.

: Try PixArt, Papillion or True Paint. Is there also a good vector graphics
: programm on the Amiga like XAct, Outline Art or DA's Vektor? Do they have
: semi-professional photostyling software? Do they have a professional DTP
: software (like Calamus SL or Didot Professional)? Are there even some worthy
: wordprocessors on the Amiga?

Yes, yes, and yes.

: Finally there is one sequenzer for the Amiga you can work with. Wow!

More than one. B&P Pro is just the one I like.

: Well, discussed... but not proofed.

There isn't a whole lot to debate, when it comes to the way they've
crippled their machine.

Do you really feel that it is necessary to inform Atari users of other alternatives, I mean I think we all know there are Macs and PC's and a heck of a lot of other computers too. The people who buy Atari computers apparently like them, why interfere? Do you think they are stupid enough to buy the Atari without considering other alternatives? Moreover, are you raving about the other groups too, informing everyone of other alternatives (i.e. Macintosh)? If not, why did you choose to appear here in the atari hierarchy? My guess is that _you_ personally dislike Atari-computers, but that has nothing to do with what the rest of us think about them. As you might remember I emailed you on this subject earlier, but I didn't get a reply.

3DO will stomp the Jaguar... hmmmm.... perhaps. I would say that Atari has made
a First, big correct step for the very first time in a lllooooooooooooooooooooooong
time... 3DO's $700 vs Jaguar's possible $200 surely makes a big difference.

And then, my main concern was if the Jaguar was vaporware or not, it seems now
pretty real... I'm waiting for the real specs.

I bought my 1200 four weeks ago (only 2Mb chip), and using a little
craftsmanship;) which included removal of the HF-shield which covers the
motherboard, I mounted a Seagate245/3.5". With this drive
I have reached 820Kb/s (diskspeed 256kb buffer) with only chipmem, so
I don't have much to complain about ;)

Well, that certainly is interesting. I think I'll post this on GEnie. They'll love to read that.

Tell us, though: what indications were there that they were giving up on the PC market? I haven't seen any indications of this at all, especially with old computers (Mega STE, TT) being put back into production and strict enforcement of the dealer agreement. You don't spend all your resources developing state of the art hardware like the Falcon, only to drop it months later. I think you misinterpreted.

The Atari Falcon is crippled...but the 1200 is a bit too. I read
the review of the Falcon in Atari Explorer and it did sound, (I can't
belive I'm saying this..Mr. DIE HARD Amiga fan) surprisingly, like a pretty
nice machine. 16 bit digital audio as a standard feature can't be bad at
all... my main problem is the 16 access to RAM which is a total blunder
on Atari's part. I'd still rather get a 1200 due to software support
and hardware support. Plus, the price of the FALCON is a bit high..but
I suppose 16 bit digital audio does things like that.. :)

Trick?? What trick? After responding to the last post, just to check and
see that I wasn't living in another universe and missed this flaw in WB, I
checked it out--opened a shell window, copied a large subdirectory from one
place to another. At the same time, I started JR-comm running (using the
ToolsDaemon running in the background, of course), and then called up the
toolsdaemon screen. AT THAT POINT I decided that YOU are living in an
alternate reality (excuse me, the original poster too), where the WB locks
up when you try to copy things. All that on a measly 2000. Your 4000
locks? Take it back. It's defective then.

Ah, I thought that's what they were talking about in the first place!!! I sure as hell don't use the WB to copy files icon by icon - never have and never will. I still wouldn't call it a bug in the OS though. Sheesh, I've never noticed it, I wonder if anyone else has. One of the reasons I HAVE an amiga is so I don't have to be like a Mac weenie.

Ah, now I understand---we aren't in separate realities, we're seeing two different things. My apologies! I never have (and never will, probably) use the iconic copying method AKA Mac style, so I've never run into this hang (if it exists, haven't checked). I use a shell, no probs at all. I'm just a die-hard command liner, I guess...:>

But nonetheless, you CAN copy things anywhere and still freely multitask, no hang ups (under 2.04 or greater). Maybe users who like to copy by moving icons around might find it irritating if the WB locks (again, I haven't verified this for myself, and probably never will), but hey, there's always a command line...:>

Funny, but you are the first one who admits that is IS true and it IS
a (minor) flaw of the WB. Sure, the WB is an application, but it is
used quite regularly, isn't it? So I don't get the point, why are those
other Amiga guys telling me things like 'I open a shell window' or
'I am using a 3rd party program','you don't have to act like a Mac weenie',
etc., when copying icons via the WB is the first method that comes to mind?

As of MiNT locking during disk access: this IS a flaw, but it's a minor
flaw also, because noone could make use out of MiNT/MutliTOS without
a HD anyways.

And that is the mistake in your article, you are judging from Amiga
experiences. Hell, the MegaSTE is 1.7 times faster than stock ST/STEs,
and the only add-on it has is a 16MHz/16KByte cache 68000.

>That's not using ONLY 16 bit memory, but a combination of 16 and 32 bit
>memory. How in the world can you justify introducing a new modern system
>with performance possiblities like that?

The Falcon is about four times, the A1200 about three times faster than
a 1040STE/Amiga500. This is an indirect comparison based on system specific
benchmarks.

-> or PAM's Hiker, two LAN programs via MIDI?

Non, i did not suppose anything on that point !!!

I'm just replying on some writing that Amiga can't do networking at low
cost, that is essentially *FALSE* !

-> What if you want to hook a third Amiga into your 'network'?

I've never see anobody that do it, but it's write in doc of Parnet that
many users could be plug.

That system have cost me only the price of a cable !!!!!

An, i can go with my A1200 visiting my friends and copy files easily,
and use my hard disk directly from their Amigas.

It's very well do !!! I can accesses devices of the other computer
from Workbench.

But, you haven't reply me :

When networking is really necessary for a home computer ?

Bye!

Brilliance is already advertised for $156 from some companies.
Anyone remember PhotonPaint, I think that's what it was called. OpalPaint
though you gotta get a 24bit board to get it. Or is that OpalVision?

The ST does have a definite advantage in the MIDI area but there is more
than one music program available for the Amiga but I don't think Greg
wanted to go hunting for the names of the other music programs in the mags.
There are eight programs in this one ad I'm looking at though don't know
anything about them.

The Amiga will have a definite advantage in the video are since that's its
niche as MIDI is the ST's niche. So these two areas are balanced out. 8-).

He is right. The _Workbench_ locks up while copying files, it shows that
neat cloud or clock pointer and you have to wait.

Of course, other programs are still functioning. So it is a different
_quality_ of 'lockup' than the Mac requesters (which lock the whole GUI
and not just finder).

Hehe :) I can't think of a single program that can compete with Signum!3.
Signum was the first program on the Atari that could print using neat
hires fonts but IMHO it is the ugliest text program in terms of usability.

>slower, the bottleneck won't be as obvious as it is with mine.

First: The whole discussion was about the speed of the Falcon against the
speed of the Amiga 1200. I will not compare the Falcon to an 68030 with
25 MHz, because you also CAN expand the Falcon with an 68030 with 32 MHz and
32bit Fast RAM!

Some notes to your example:
1. The old 16bit bus in your Amiga 500 is running with only 7.1 MHz. The
32bit bus of you Fast RAM is running with 25 MHz. That makes a factor of
3.52... The whole Falcon board runs with 16 MHz.
2. On the 16bit bus in your Amiga 500 are also accesses from video, Blitter
and DMA. They can't access Fast RAM (that's one of the reasons that it IS
Fast RAM). These accesses are also slowing down the 16bit bus.
3. You are testing only the memory fetches. Every program is also doing
other things (calculating, bit-operations...) which will be faster on
a 16MHz-68030 than on an 14MHz-68020. So you have to correct the whole
perfomance of your system.

Overall, your example is really impressive... but shows nothing :(

>ONLY Amiga Makes It Possible...

...that nowadays computers are manufactured with 880 Kb diskdrives.

Ciao, Heiko.

>memory fetches out of the cache? How many memory fetches are longwords?
>And don't forget that a 68030 with 16 MHz is faster than a 68020 with 14MHz.
>So which system is faster? Nobody will be able to answer this question
>including you.

Running at equal clock frequencies the 68030 is faster due to two
architectural reasons: internal harvard architecture and faster
external bus. The former means that data and instruction caches
can be accessed in parallel, the latter refers to faster syncronous
2-clock bus cycle and burst fetches. NEITHER OF THESE ARE AVAILABLE
ON A 16-BIT SHARED MEMORY SYSTEM ("chip ram" or anything like that):
You can't cache data and you can't perform syncronous or burst
memory cycles (both imply 32-bit port size and to do burst transfer
you need deterministic access to the memory).

So you end up with the 68030 doing exactly the same memory
accesses as the 68020 but on a 16-bit bus. Need I remind you that
every instruction fetch cycle is a longword fetch (that was the
case even with the 68000).

Please stop making these "68030 is faster that 68020 because an ad
said so" statements and either believe what you're told or find
out about the details yourself (even the details of the old 68020
being quite interesting). In it's very own way the 68020 is still
a great chip, especially considering the amount of ugly 386's that
are still around.

> (Net is a drive, or special commands needeeds ...)

First of all: calm down. Try to argue.

The built-in HD drives have transmitting rates from 400 Kb/s to 800 Kb/s.
That's because of the different drives Atari uses. The better perfomance is
done with Conner-drives.
I still haven't bought a SCSI-drive, but wait, i soon will have one.
The SCSI-interface built in the Falcon is a full SCSI-II interface. Get the
details from a SCSI specification. It's sad but it's true, that there is
very little information about the Falcon hardware available. I hope this will
change soon.
The Falcon LAN port has the same specifications like Apple Talk (it IS Apple
Talk :). That's fast enough for small nets, but sorry, i still have only one
Falcon and couldn't test it. The network commands (and organisiation) depends
on the network software and has nothing to do with the hardware.

Ciao, Heiko.

Hmmm... Maybe I'm the only AmiOwner that uses WB in combination
with the shell (I would die without a shell...). I would use the
WB more if it was friendlier (Oops, now I'm labeled: ``MAC
weenie'' for all time to come :), but C= are really slow when it
comes to polishing the applications (But the OS they rest upon
is getting really nice'n'shiny ;)

> As of MiNT locking during disk access: this IS a flaw, but it's a minor
> flaw also, because noone could make use out of MiNT/MutliTOS without
> a HD anyways.

Minor flaw? Hmmm... picture this scenario:
I don't own a mega-fast modem, so whenever i want go get
some pd s/w i grab a bunch of disks and run down to the
sparcs on campus to get it by ftp...
Then when I get home, I have, say 10 disks with lha'ed
files... Then i pop one disk in the drive and run a
small script to unpack all the files onto the HD (in the
background, while doing something else!!!) On the Falcon
the machine would completely lock up during this
process... (The same goes for HD-backup, most people
don't own a streamer... (OK the 1200 doesn't have a
clock, but there are other ways to get the sysclock set
correctly ;))
Hmmm... by the way, while on the lockup-topic, them
dialogue-boxes, does GEM still lock up completely when one of
them pops up... I remember that I was quite irritated by this
<bing> when I owned an TOS-based machine :-o, but they have
corrected this, haven't they? (Just curious).

Hope? Maybe for big bucks! "It'll never happen! We're all doomed I tell ya!" "IT's *not* on sale" "I'm a guirilla!!"

Could this be the "alleged" upgrade path we've all been waiting for? Could this provide a short-term solution to the long-term problem of the shift to RISC? Will Commodore bundle a *decent* game with their new CD-console? Will I expode, scattering remenants of Mozerella all over this group ???

Read it and weep ..... Squigg posts another Copyright-dubious extract from UNIGRAM-X "THE WEEKLY UNIX NEWSPAPER" :)

*SNIP!*

_________________
+ ONLY APPLE's POWERPC WILL HAVE 680x0 INSTRUCTIONS IN ROM

Apple Computer Inc, it seems, has a vanilla implementation of the IBM/Motorola PowerPC 601 microprocessor designed specifically for its Mac emulator technology, which leaves IBM - currently the manufacturer of all 601's - busy working on its own 601 implementations. The emulator technology is paramount to Apple's PowerPC strategy, providing interoperability and compatibilty with its Macintosh System 7 and future System 8 operating system and existing Mac applications. At the microprocessor level, Apple's 601 ROM has been separated from the PowerPC CPU - it sits outside the chip - and has had Motorola's 68000 instruction set embedded into it to translate 68040 instructions into RISC code the 601 can understand. To the rest of the system and to the end user there will be no difference in look and feel to an existing Mac machine, says the firm. But the ROM technology is Apple only and won't appear with any other PowerPC solutions, says Apple's PowerPC product manager, Jim Gable. Other PowerPC developers will have to support Mac emulation through PowerOpen, the trio's AIX-based operating system for the architecture, via products like Insignia Ltd's SoftPC and Echo Logic Inc's emulator. Apple has also done some fancy footwork at the systems software layer, providing mixed-mode functionality allowing applications written via ToolBox, the company's Mac programming tool, to be transferred back and forth between RISC and CISC environments. To do this Apple has converted two of its most used tools, Quick Draw and Memory Manager, into RISC code, so applications can run on both architectures. Application performance is not affected, claims Gable. The rest of ToolBox will be re-compiled to RISC code over the next year or so. The first 601-based Macs will be released in January/February next year and will be phased in with

the firm's existing Centris and Quadra server lines. Gable says Apple expects to shift one million units of 601 Mac by the end of the year. The company has no plans to support any other operating system except PowerOpen and says Microsoft Corp's Windows NT is "definitely not on the cards". Meanwhile, silicon schedules for the other PowerPC microprocessors are still on track and it expects the low cost, low energy 603 CPU destined for laptops and notebooks to begin silicon sampling early next year. The mid-range 604 chip should roll-out late 1994 and the symmetric multiprocessing 620 in 1995, the firm says.

In my infinite helpfulness I have done a fairly comprehensive comparison
of the A1200 vs the Falcon 030. It covers CPU+architecture, I/O,
graphics, storage capabilities and sound.

The sound section is very sketchy but the rest seems to be OK.

I am posting it under the title "A NEW A1200/F 030 comparison."

I look forward to revising and updating the piece as and when new *factual*
information becomes available.

yours

Xavier

I'd like to verify this before claiming it, but with bios-buffering
turned on, I'm pretty sure the thing doesn't lock up. (I'll test it).

The idea is that the floppy writes a block, but then pauses until
another block needs to be written, at which point other processes
get a look in.

A program that I have called MikeNET (PD/Shareware via FTP) does just that
for two computers, each can share the drives of the other. This does NOT
cause hassles for the user of either computers & runs as a background task (with
or without MultiTOS).

A forthcoming PD release is the MiNT/MultiTOS Network FileSystem, which allows
multiple machines in mixed topology Networks (AppleTalk/Midi/RS232) with
remote file & device access, and also X-Window style Remote Applications
(run the program on one machine & the display on another), dumb terminals can
access the network via a serial port login on any machine (so dumb IBM's can
hook into the net as terminals).

Show me an Amiga system that does that (Net.xfs runs on ANY ST/TT/Falcon
with 1Meg+).

You have? Now show me an Amiga system that does it for FREE......

Love & Llamas, Craig.

Gregory writes (while flaming big time :) :

I have gone over, and over, and over what I consider flaws in the basic design of the Falcon. Their misguided use of a 68000 interface to the outside world in their processor slot, the mindless slaughtering of a 68030's performance by placing it on a 16-bit bus, the use of a rather ancient DSP, the OS itself... I'll not go over them again for at LEAST another week, I've got no wish to write an FAQ of what I consider design flaws.

Right! Can we have some decorum here! I *demand* it! There ... that's better ;)

*BIG REQUEST*

Can everyone MAIL me with their points on the Motorola DSP56001 that resides in the Falcon? I know I asked this before, and failed to act on it, but THIS TIME, I am going to present all the views to the DSP56000 team that designed and support said processor.

After they "assimilate" the criticism, they will give their own valued and 'un-biased' response, based on their knowledge of the device.

Can someone also fill me in on the model name of the DSP Commodore is allegedly bringing out?

Thanks! Maybe at last we can see this argument from both sides, as it was rapidly turning into a "If it's in an Atari, it sucks!" argument, but Hell! I enjoy them as well!

Please! Lets get this moving .... this could start a massive intercontinetal flame war, and I sure as hell want to get dug in :)

No...the 68000/010 does word sized (16 bit) instruction fetches.

Being smart? Yes indeed the 68000/010 data bus is 16 bits wide but
it always fetches code in longwords, the implication being nothing
much more than that e.g. the Amiga can be reset in software.
That is, if two one-word instructions share the same longword-aligned
memory location then both of them are fetched before the first is
executed. Even on the 68000/010.

I'm quite sure you knew this.

Sorry Kevin, but you didn't get the point. A shell is a new task.
You should use the wb, not a copy-utility or the shell. You have to use
the mousepointer on wb-screen: Take a large file from a floppy-disk and
put it into the ram disk. (You'll see, the wb is locked.)

Just hold down 'shift' and you can copy more than one file.
(I don't know, weather this works below 2.0)
I hate to start any utilities just for some files.

It is not a flaw. The program (Workbench) simply does not have internal
multitasking. Very few programs do. I think Real3D 2.0 does. Since
multiple applications can always be launched, even while the Workbench
is performing a task, there are only problems for those who know nothing
more than the GUI.

Yeah, the whole argument is silly, anyway. The Workbench doesn't lock when
it's copying files; it is copying files. One might as well say that an
animation program locks when it is animating.

And of cours it is called 'intuitive use' when you are starting your copy program etc., isn't it? Sorry to do some Mac advocacy here, but 'Look&Feel' really IS something different (BTW even Atari users have copy programs such as Kobold 2 etc., but at least with MultiTOS you are able to replace the standard copy routines with these progs. This will speed up things a little bit...).

My point is that I shouldn't _have_ to skip your posts because they
shouldn't _be_ in comp.sys.atari.st at all!

As for "informing people who may want to change their minds about the
Atari platform..." If people have any desire to see how the Atari
line stacks up against similarly-priced offerings from other
companies, they should read comp.sys.atari.advocacy. That's why it
was created. It's the _appropriate_ newsgroup for such discussions.

Definitely different than the way OS/2 2.X works, where almost all
applications (including the GUI) are multi-threaded. No lock-ups when
copying/moving files using icons ...

Ahum, forthcoming means it's still as non-existing as Workbench 3.1,
right? You won't know which network facilities 3.1 has until it's released...

>You have? Now show me an Amiga system that does it for FREE......

Don't know which programs are out there already with such facilities
(and frankly, I don't care, because I never use them anyway), but
you *could* consider networking support a 'free' add-on when you
buy (upgrade to) Workbench 3.1 :-)

Mine doesn't lock. It copies the file from disk to RAM. Your machine
must be broken.

Of course, if you are using MultiTOS, you can carry on using the desktop when copying or deleting or formating......you can even start several copy actions going at the same time. This is using the COPY option from the desktop, not using a cli, or clicking on a seperate program.

I just don't get it. Do I have the perfect system or something? My
A500 has NEVER locked up on me while copying files! It simply doesn't
happen.

> As of MiNT locking during disk access: this IS a flaw, but it's a minor

>
Minor flaw, bullshit. Are you telling me you would NEVER have an occasion
to use a floppy? I use them a lot. Since I don't have a fast modem, I
download big files by copying them onto floppies on the Suns up at the
school, then bring them home and read them. That's not a minor flaw, that's
inexcusable. What would you do if you were giving a friend a few programs?
Hook up the modems for a couple hours, or do you let him borrow your HD?

You know, that's ALMOST similar to the 14 mhz/cached 68000 accelerators for the Amiga, like AdSpeed. Except, they come out 2x faster than the stock machine. True, I was judging from Amiga experiences since I obviously don't have an Atari, but it illustrates quite well a 68030 having to go through a 16 bit bus. The faster 68000 accelerators do better.

The benchmark is the plain ol' dhrystone benchmark. Can somebody please create a program with gnu c or something that we all can use, that will create a definite answer to who runs faster?

Well, this happens under MiNT also. For example, I've been compiling,
and unzipping files simultaneously on the same drive and same partition with
no problems as long as I do this from two seperate shells.

Please be clear and state that this is a floppy-only problem under MiNT
when posting.

>flaws.

Well, here's the flaws of the Amiga 1200:

1) no built-in high density drive
2) no onboard support for a SCSI hard disk standard (although IDE is tolerable)
3) inadequate sound capabilities for professonial music (this is *my* list,
so this will vary for others...)
4) no clock (minor gripe? or is it? who wants to pay extra?)
5) one 32-bit expansion slot means you have to buy one good board (pass-through
would make this irrelevant in one respect, but how to fit multiple cards
on the machine?)
6) no DSP (as opposed to Atari's "ancient DSP"... any DSP is usually better
than no DSP :) )
7) it is using a 68020 as opposed to a 68030. If they put 32-bit access into
it, then why not give the machine a full '030? Did they just want to
make sure it didn't copete against the 4000/030? Or was it a design
decision?

I don't want to get in to flaming the OS for the Amiga because while I think
certain aspects of it can be improved, if we all had to pick the ideal OS,
everyone would surely choose something different... and we'd all debate the
merits of OS/2 vs. Windows NT vs. *nix vs. MultiTOS vs. AmigaDOS vs. etc. etc.

I think the price difference between the two machines may favor the A1200
on first glance, until you realize you get a 880k floppy instead of a 1.44MB
drive, you get no DSP, no SCSI-2, no 16-bit sound, no LocalTalk ports, no cart
port, and no stereo input jacks, but instead , it does offer slightly
better (this is subjective, and possibly could change as more device drivers
pop up for both machines' flexible video chips arrive) video, 32-bit CPU
access to standard RAM, and a more mature OS (but I would hesitate to say
"better" because that's in the eye of the beholder).

Anyone who cannot see that the two companies were obviously motivated by
very, very, VERY different design goals has to be blind, and what some of us

may think of as "design flaws" may have been necessary to meet the percieved demands of the markets they developed these computers for.

Not a flame but an idea: can't WB just spawn another process to copy the files while it chugs along, and should the copy need to be aborted, send a signal to the copy process to stop?

>

Now add the price for the networking PORTS. And consider what type the end user will want. Do you want to run it off your serial port? Will you still want to use a modem if you're networking?

Question: do any Amiga models come standard with networking hardware built in? If so, which ones, and how much do they cost?

Incidentally, while following this thread... an interesting thought came to mind... as most A1200 and Falcon owners will be upgrading from previous machines by both companies, an inexpensive network does make sense as the user won't have to ditch one computer totally for the "new" one. A Mega STe owner could run MiNT, drop in the forthcoming .XFS net driver for the networking ports, and hook it up to the Falcon and share data immediately.

I wonder if my old Coleco ADAM is up to Localtalk.... :)

The Jaguar does not include the cdrom as standard equipment, the 3do does.��
The $700 price is prliminary, my guess the price will be $500 when released.
The 3do consortium will market it. Marketing is still alien to Atari. Look at
Atari's track record, ie the St and LYNX. I have the only lynx in my
neighborhood, everyone else has the lame boy.

>little bit of serial port game playing. Why tack on extra networking hardware

One the one hand i have seen people argue that the fact that the the F' 030
and A1200 are aimed at different people/markets is not important and that
the A1200 is just a better machine, and then we get the argument that
it doesn't matter what the F' 030 has *built* *in* as any A1200 owner
can just go out and buy the add on.

Its just a basic fact that that the A1200 and the F' 030 are aimed at very
different markets that seems to be beyond the understanding of the A1200
users.

Actually it is quite annoying, super fast graphics and sprites they say
are *soooooo* important that any machine that does not match is crap and
then when someone points out that the A1200 has a pathetic range of I/O
and backup options they say that these things are not important.

The F' 030 vs A1200 debate is kind of stale and useless, for me the
oodles of options, techie stuff (DSP programming would look ok on
my CV, as would writing device drivers for SCSI interfaces) and so on
on the F'030 *make* the machine. For the A1200 the graphics make the
machine. Beyond this basic point everything is just hot air

> a signal to the copy process to stop?

Actually the WB 2.x spawns two tasks (called WBR and WBW I think), one for reading and one for writing. If you copy e.g. from harddisk to floppy, both DMA channels can run the same time (the function SameDevice() will be used to determine, wether the source and the destination are on different physical drives to not waste time by heavy head movements).

The master WB task isn't locked up either. It gets all your messages, such as window refreshing, scrollers/arrows etc. but refuses to accept 'clicks' and menu selections (i.e. ignores them).

Also when some of the files already exist, the master task pops a requester while the WBR task continues to read the source files and WBW task writes those files, which are not duplicate.

This should clarify some things.

Wether these are prefetched depend on the previous instructions. For the
68000/68010 these instructions do not need to be longword aligned because
these cpus use a 16bit instruction fetch (the instruction prefetch queue
is just long enough to hold them both).

Lack of multithreading, in my opinion, is a BIG flaw in the WorkBench
application. However, you can go around it; it is merely one application.

: used quite regularly, isn't it? So I don't get the point, why are those
: other Amiga guys telling me things like 'I open a shell window' or
: 'I am using a 3rd party program','you don't have to act like a Mac weenie',
: etc., when copying icons via the WB is the first method that comes to mind?

For some, its not. For some, the instinct says to go to their
file/directory manipulation tool, and move their files/trees/etc. in a
manner they've grown accustomed to, through tools such as Directory OPUS,
etc. For others, the instinct _IS_ to go to the shell, and those people
are often the types who barely, if ever, use the WB.

Don't assume that everyone's first instinct is the same; I came from a
command-line background, and my first instincts ranged from using a
directory utility like I did with my ST, using the shell like I did with
countless other systems, or to using the WB.

These days? Don't ask. It's still random.

: As of MiNT locking during disk access: this IS a flaw, but it's a minor
: flaw also, because noone could make use out of MiNT/MutliTOS without
: a HD anyways.

A weak excuse, at best, and not at all technical. If there were some
technical reason, it would be best to use it--but this makes it look as
if you're willing to overlook flaws simply because it doesn't pertain to
what you believe as useful/useless.

This is what has freaked me out the most about OS/2, it multitasks
even better than the Amiga. I've begun to use the GUI for copying
files very quickly, instead of resorting to opening a shell to do
so. The ability to use the GUI without lockups is quite nice, but
I'm not positive that a low-powered machine could handle it too well.

A problem that has no good technical reason for existing, other than the
poor design of the OS itself...

: Well, here's the flaws of the Amiga 1200:

: 1) no built-in high density drive

FIXABLE: Buy Amiga HD drives, they exist.

: 2) no onboard support for a SCSI hard disk standard (although IDE is tolerable)

FIXABLE: Buy a SCSI subsystem for your 1200.

: 3) inadequate sound capabilities for professonial music (this is *my* list,
: so this will vary for others...)

Currently, no solution exists, though one is said to be on the way.
Solutions exist for ZorroII/III equipped systems, however.

: 4) no clock (minor gripe? or is it? who wants to pay extra?)

FIXABLE: Buy a clock.

: 5) one 32-bit expansion slot means you have to buy one good board (pass-through
: would make this irrelevant in one respect, but how to fit multiple cards
: on the machine?)

One 32-bit expansion slot leaves you in the same boat as the Falcon. And
there's still the 16-bit PCMCIA.

: 6) no DSP (as opposed to Atari's "ancient DSP"... any DSP is usually better
: than no DSP :) )

So you consider lack of a DSP a flaw in the design? Fascinating. Not
very logical, but fascinating.

: 7) it is using a 68020 as opposed to a 68030. If they put 32-bit access into
: it, then why not give the machine a full '030? Did they just want to
: make sure it didn't copete against the 4000/030? Or was it a design
: decision?

Cost. Why use a 68030 when all you need is an 020? They wanted a
low-cost system, and an EC020 is cheaper than an 030 by a respectable
margin. A better question is why did the Falcon bother to have a 68030
in it if they were going to cripple it so heavily.

Your list of "flaws" aren't much of flaws, just omissions. They're
fluff, things that sit on top of your fundametal system design, and as
such, are easy to fix.

The Falcon's flaws, however, run much, much deeper, as you already know. They're unavoidable, unfixable, because they're at the bottom of the system itself, the very foundation of the design.

Think about it.

cmedley@wam.umd.edu ('Flip' Medley) writes:
>
>Well, here's the flaws of the Amiga 1200:

And my comments. :-)

>1) no built-in high density drive

I, for one, don't care about high vs low density drives. They are just
floppies, after all. Developers (including game-makers) should be
encouraged to force all software to be stored on the harddrive. Of course,
the software must come from somewhere. CD-ROMs would be perfect.

>2) no onboard support for a SCSI hard disk standard (although IDE is tolerable)

In the low-end machine, IDE should be plenty. Especially since
SCSI controllers have been available since the machine was released.

>3) inadequate sound capabilities for professonial music (this is *my* list,
> so this will vary for others...)

I agree, but since the Falcon already fits that category, the Amiga can
focus on graphics and try to get some profession business software.

>4) no clock (minor gripe? or is it? who wants to pay extra?)

I think that's a major flaw. Every computer should have a clock, just
like every 030 should have a 32-bit bus. :-)

>5) one 32-bit expansion slot means you have to buy one good board (pass-through
> would make this irrelevant in one respect, but how to fit multiple cards
> on the machine?)

Hmm, the A1200's expansion features seem great. That one 32-bit slot can
be used for the accelerator, memory, SCSI, and clock. A low-end machine
can't really do better. The PCMCIA can be used for the DSP. Trying to
add Ethernet and graphics boards to the A1200... well, it may soon be
possible, as with the A500. (There is an OpalVision adaptor coming out,
but this may use the 32-bit slot.)

>6) no DSP (as opposed to Atari's "ancient DSP"... any DSP is usually better
> than no DSP :) )

I guess the musicians will complain, but DSPs are not so common, yet.

>7) it is using a 68020 as opposed to a 68030. If they put 32-bit access into

Commodore probably wanted the cheapest 32-bit chip. I have no complaint with this, but they could at least reflect there decision with a reasonable price.

>I don't want to get in to flaming the OS for the Amiga because while I think
>certain aspects of it can be improved, if we all had to pick the ideal OS,

>merits of OS/2 vs. Windows NT vs. *nix vs. MultiTOS vs. AmigaDOS vs. etc. etc.

I was using OS/2 very briefly today on my office-mate's 486/66. I was disappointed about the speed, but I didn't have time to try many apps. Scrolling text is lightning fast (the machine has localbus video), but opening windows... I guess I just expected a bit more from a 66MHz chip.

This does sound great, but I've never had a problem with the Amiga's
multitasking--even on my 68000. The MultiTOS GUI may be superior to
Workbench in this regard.

>Get a life - get a Falcon :)

Not unless it has 17" tires and 400 horsepower. I'd rather get a real
machine like that, though it'll take me a few years...

Exactly. And if it wished, it could place up a "progress requester"
giving the user the ability to abort, as well as seeing how much of the
copy has been finished. However, currently, neither exists.

>SOME AMIGA 1200 USERS HAVE POST HARD DISK PERFORMANCES.

>**** NO ATARI FALCON USER HAVE ALREADY POST THEM ****

Well, I don't have a Falcon, so I'll post the results for my Mega ST
scsi ! drive. It's a Quantum lps52, hooked up through an ICD interface.
I imagine Amiga owners are familiar with ICD as they also make products
for the Amiga.
My Quantum LPS52 measures 1.15meg/sec with a seek time of 22ms. That's
using ICD's RATEHD program. My Syquest 44 got 795, and had a 40ms access
time. Asute readers will notice the access times are consistantly higher
than the companies who make the drives claim, but I've found this to be
true with every drive I have had.
This, of course, because it's an ST, is also going through the
overhead of a scsi to asci adapter.
Also, for those claiming that IDE drives are cheaper, the IDE
version of the Quantum LPS105 lists locally here in Vancouver for
$350CAN, compared to the scsi version at $395. Not really that
significant a differrence.
The Quantum LPS's are probably the fastest sub-gigabyte drives made,
from what I've heard, so I'd be interested to see if any Amiga owners
have an IDE version to speed test against these figures.
Someone on another comp.* group recently posted an analysis on why
no scsi drive using the current drive standards (300rpm x however many
sectors per track they can squeze in) can possibly exceed ~1500k/s, so
the benefits of scsi 2 seem a bit ahead of itself at the moment.

This has nothing to do with the 68000/010 instruction fetch cycles,
which are indeed 16 bits in size. All you are demonstrating here is the
effect of the processor prefetch queue. The actual fetch cycles themselves
indeed remain at 16 bits.

: Its just a basic fact that that the A1200 and the F' 030 are aimed at very
: different markets that seems to be beyond the understanding of the A1200
: users.

Both are aimed at general computing, both have separate niches that the
systems fit into. The F' 030 is ONE system; one architecture. It must
take the place of an entire LINE of other systems, on the Amiga.

Just a sidenote, I have no intention of comparing it against anything
other than a 1200.

: Actually it is quite annoying, super fast graphics and sprites they say
: are *soooooo* important that any machine that does not match is crap and
: then when someone points out that the A1200 has a pathetic range of I/O
: and backup options they say that these things are not important.

"pathetic range of I/O and backup options"? That's pretty rich, buddy.
Add SCSI, its an option. Suddenly, disk IO gets a lot better, and you've
got backup options galore. So perhaps you should take a little care in
what you say...

: The F' 030 vs A1200 debate is kind of stale and useless, for me the
: oodles of options, techie stuff (DSP programming would look ok on
: my CV, as would writing device drivers for SCSI interfaces) and so on
: on the F'030 *make* the machine. For the A1200 the graphics make the
: machine. Beyond this basic point everything is just hot air

For the A1200, the MARKET makes the machine. The nice stuff about the
1200, unlike the Falcon, isn't all from the parent company... Falcon
support is in its infancy, while the Amiga, and the 1200, have options
that the Falcon does not, and may not for some time due to the
marketplace.

And that is something to consider.

Well, ideally, I'd like a DEC Alpha in the A1200, but considering cost... :)

I want a DSP in the machine because it's a plus. When such things become
standard coprocessors in machines for various purposes from voice analysis
to acting as effects processors on sound and video, we'll all wonder how
we got along without them.

Why not have one to start with?

And I'd be foolish not to say I'd like to have a powerhouse like a 56001
under the hood of my "base" machine over the option of no DSP at all.

(i guess i've gotta drag the Falcon in to this, eh?)

To be fair, were I on a PC, my concern for a DSP would be lessened because
outboard cards that are well supported for both sound and effects processing
do exist already.

Well, how often do you REALLY do this? I know CrossDOS is slow, but
copying disks to RAMdisks directly would make you a diskjockey, even on
the Amiga.
> Hmmm... by the way, while on the lockup-topic, them

Thank god there is a patch for that, MultiDialog 1.02 (.03? still
wondering), presenting you with a window instead of a dialogue-box.

This should be shipped with MultiTOS, IMHO, as well as some other neat
enhancements (Selectric, Kobold 2, GEMview, NVDI, etc.).

>Still, add $$$.
>Why didn't they put a 1.44 MB drive in the A1200? Any good excuse for C=?
>For how much? $100?
>Sure. Right. Add $20-$30.

*YOU STATE YOURSELF* that to bring an A1200 up to a Falcon, you need to spend, and I quote, "$$$"

In the UK, where Commodores real markets are now, an A1200 with 2MB Chip Ram retails for #300, ok?

A 1MB (unusable) Falcon costs *NEARLY #300 quid DEARER!*

Europe and the world is in a major recession, so why in gods name did Atari release the Falcon at a price VERY few households over here can afford? The A1200 and the Falcon are aimed at completely different markets, and I think Commodore was damn right to release the A1200 with the minimal components needed to do the job (ie. be a powerfull,colourfull,usefull (:-) home computer.

You really need to compare the Falcon to the A4000/030, like it or not, because a Falcon with hard drive and 4MB RAM costs *exactly* thesame price over here, for a similarly equiped machine, and the A4000 shits all over it, frankly, apart from the DSP, which I'm quite envious of :)

Omissions ARE flaws.

OMISSIONS ARE BUDGET DECISIONS! REPEAT 10 TIMES :)

And fluff to you is an important asset to another user.

People *don't buy* A1200 to be powerhouses, they buy them to have a nice home computer, and they wanna buy them cheap!

Seems I haven't been too thorough about the inner details of the 68000
myself. The keyword and only reason to talk about longword instruction
prefetch was the longword-alignment requirement of my example and since
that is not the case on the 68000, my argument was nil.

Demonstrating the effect of prefetch was my point in the very beginning,
i.e. the CPU fetches instructions in advance and does it using longest
possible word reads. And sometimes ends up fetching instructions that are
never executed. This was only to say that there's no need to speculate
about the percentage of potential longword cycles when instruction fetch
is concerned, even though the actual length of an instruction varies.

And I prefer fixed-length (longword) instruction word machines anyway. :-)

>>
>For how much? $100?

A good SCSI interfaces will cost more. Compare it with the Intel-market:
a SCSI interface fully SCSI compatible (not that crippled Seagate stuff) will
cost more than $200.

>And I'd be foolish not to say I'd like to have a powerhouse like a 56001
>under the hood of my "base" machine over the option of no DSP at all.

The 'old' 56001 has also some advantages ageinst "better" DSPs:
It was already used in the NeXT and the Indigo machines (NeXT DSP has only
8 KByte RAM - the Falcon has 96 KByte...). There are thousands of routines
especially for this DSP ready for upload in the Motorola mailbox.

And:
FIXABLE: 32bit Fast RAM for the Falcon. But that wasn't the point...

Ciao, Heiko.

Sorry, according to my system specific benchmark the A1200 is exactly 392
times faster than the 1040STE and 5 times faster than the Amiga 500.

It is your mistake that you trust such benchmarks for system comparisons.

Oh yes! Commodore should have used single sided floppys. The whole world is using HD-disks except those little Amiga freaks. I think you don't know what you are talking about! This DD drive is a MAJOR disadvantage.

>>2) no onboard support for a SCSI hard disk standard (although IDE is tolerable)
>
>In the low-end machine, IDE should be plenty. Especially since

Yes that's right. But try to connect other periphery to your IDE controller. It's a very good feeling to have a SCSI interface.

>I think that's a major flaw. Every computer should have a clock, just
>like every 030 should have a 32-bit bus. :-)

Oh come on! Have you EVER seen a Falcon running software? Hav you ever recognized those "massive loss of CPU-speed"? The size of the bus is quite uninteresting! 10 % CPU speed more or less - who cares?

Ciao, Heiko.

NeXT had 8 K _words_ (i.e. 24bkByte) for the DSP. And there aren't thousands
but just a few dozen programs on the Motorola mailbox.

In America, a 2MB no HD A1200 was $600 when it came out (this was actually the pre-release price at Buried Treasure in Rockville,MD which they claimed would increase after the release, though I think $600 probably stuck as the price...).

The Falcon with 1MB and no HD is $799 (MSRP) here. The typical configuration is the 4/80 model for $1250 (they upgraded the hard drive to an 80MB IDE).

Granted, there is a $200 price difference, but you have to consider that they are adding in a lot of standard components for that price... I won't repeat them all again, but it does sound like at least $200 worth of goodies.

>A 1MB (unusable) Falcon costs *NEARLY #300 quid DEARER!*
>

Not sure what that means.. do you mean the Falcon costs #500 there and the A1200 only #200? If so, I can see why you'd buy an A1200 over there. :)

Well... OK, I don't really use disks all the time, but when I do, I want it to be as transparent as possible. Sure the Amiga diskdrives aren't the fastest things around, but I rather have a system where *floppydisk*-access can be simultaneous with other system operations... Ie checking the stuff that's unpacked while other things are unpacking (from disk)... Of course this could be done on the F' too, i guess, by using a large input buffer for the program reading from disk, so that the system only locks up temporarily while grabbing a full buffer... But I still *HATE* when a machine locks up (happens in all OS's I guess, at one point or another, but usually system lockups are due to *MASSIVE* (over-)load on some h/w (sub)system...)

> Thank god there is a patch for that, MultiDialog 1.02 (.03? still
> wondering), presenting you with a window instead of a dialogue-box.

Ok, there's a patch... those things usually pop up to fix broken parts in an OS ;) Just have to wait for the `MultiFloppy x.y' then...

> This should be shipped with MultiTOS, IMHO, as well as some other neat
> enhancements (Selectric, Kobold 2, GEMview, NVDI, etc.).

Or... maybe GEM should have been rewritten from *scratch*, or is this being done?

ObNostalgia: I remember (with horror) my attemps to do AES/VDI programming way back when I was an Atarian (Ahh... that nice 1.0([12]?) filereq that bombed when you typed `_' in the pathline ;). VDI was cute thou... and GDOS <sigh>
Oh... sorry... off topic... ehh...

|>
|>
|>
|> AMIGAS 1200 SUCK TO DEATH!!

Very very orignial, you get a 10 for being
so original.

|>
|> BUY A GOOD COMPUTER, BUY A FALCON!

Or an Amiga.

|> Falcons have a 68030 processor 16Mhz, A1200s do not!

A1200's have 32-bit data path, Flacon's do not.

|> Falcons have a socket for a MC68882 coprocessor, A1200s do not!

Falcons are more expensive than an A1200. With the price difference
you can have more memory, internal clock and MC68882 FPU and still
have room to spare (spend). Add $250 to $500, $750 (US dollars).

|> Falcons can easily have games with 65536 colours, A1200s do not!

False. The amount of memory to move increases, and an A1200 can
have a game in ham-8 easily for adventure type games, and even
some arcade games by using sprites too, which the Falcon does not
have. Ham-8 is over 256,000 colors out of 16.6+ million...

|> Falcons have a DSP processor 32Mhz, A1200s do not!

True, and nice Falcon advantage.

|> Falcons have 8 16bit sound channels, A1200s do not!

True, and nice Falcon advantage.

|> Falcons have MIDI in/out, A1200s do not!

True, not essential for everybody though.

|> Falcons have SCSI-II, A1200s do not!

You can add it.

|> Falcons have LAN built in, A1200s do not!

True, but you can add it.

|>
|> A1200s SUCK TO DEATH, Falcons do not!

Oh, really? Which computer has more powerfull software to run now.
Better operating system. A1200.

And:

A1200's have dual-play playfields and multi-parallax scrolling.
Dual-playfields are very important for games, Falcon's do not.

A1200's have Sprite graphics, which are orders of magnitude faster
than the Falcon's graphic for action games. Falcon do not.

A1200's blitter is faster than the Falcon's, as A1200 requires
less operations to accomplish same results.

A1200's have a copper-list processor which is essential for
doing some neat multimedia tricks (look at Scala) and games.

The Falcon is good, and the A1200 is good. It depends on your needs.
Saying that an A1200 sucks is a sign of a very short-sighted mind.

And BTW: US $1,200 for a Falcon

You can get a small hardisk + 68030 @ 25Mhz with 2 megs fast ram for the
A1200 by matching the same price. a 68030 much faster than the Falcon's,
supporting burst mode and with a true 32-bit data path.

^^^^^^^^^^^^^
contradiction in terms. You said good computer ;)

> Falcons have a 68030 processor 16Mhz, A1200s do not!

A badly disabled 16MHz 030! It resides on a 16-bit bus.
The 32-bit 14Mhz 020 in the A1200 is only 1/3 slower

> Falcons have a socket for a MC68882 coprocessor, A1200s do not!
Ah-ha. sorry, but they do!! Its about 1.2 cm away from the CPU.
check before you speak!

> Falcons can easily have games with 65536 colours, A1200s do not!
yes they can. VERY SLOW ONES. Due to the A1200 have custom graphics
chips, we can have 65536 colours flying around too!

256 colours is just a plain boring mode (IN ANY RESOLUTION)
we can have 265,000 colours in ANY resolution!
Your 65536 col. mode is 320x256 only!! ha ha ha ha

> Falcons have a DSP processor 32Mhz, A1200s do not!
A crap Motorola 56000. Yes.
So what, you have one. We have a forthcoming one.
An AT&T3210 which is able to totally whip ass with over 30MIPS!!!
All techies that I have talked to are very impressed by the AT&T...
its used in workstations that require POWER!

> Falcons have 8 16bit sound channels, A1200s do not!
tryed playing them all at once yet? Big samples?
our DSP could supply 12 16-bit channels in stereo.
But hey, Amiga samples are much clearer due to Paulas 50Mhz DAC.

> Falcons have MIDI in/out, A1200s do not!
Any amiga owners can CHOOSE which midi interface to get
(thats if they want to use it for MIDI)
I personally have a MIDI interface with thru-port, 2 out 1 in and 2
thru.

> Falcons have SCSI-II, A1200s do not!
Oh dear. They've called it SCSI-II but it isn't full implementation.

Plug in a SCSI-II drive and it will be used as a SCSI-I
HARDLUCK.

Anyway, a CSA twelvegauge will provide
1) 50MHz 030 with 50Mhz 68882.(which will blow away a Falcon)
2) a 10MB/sec SCSI-II port
3) up to 32MB of RAM (isn't 16MB the most the Falcon can have? :) )
All for less than the price of a 4MB falcon :)

> Falcons have LAN built in, A1200s do not!
Oh yes...that.
1) it uses the DSP - so there goes your DSP usage
2) Are all Falcon owners gonna use it? - specialist usage only.
anyway, LAN's suck. Better to have InterNet port :)

> A1200s SUCK TO DEATH, Falcons do not!
>^^^^^^^^^^^^^^^^^^^^^^^^^
1) really? can i use it as a hoover then? wow! A1200 have a vacuum port! :)
or 2) shouldn't use it for that kind of sexual perversion then :)

[crap .sig deleted :)]

Buy a computer that is available in quantities and has some actual support, other than rabid fans who'd rather argue about anything just so they don't have to admit they made a bad choice.

> Falcons have a 68030 processor 16Mhz, A1200s do not!

A1200's have a 32 bit bus connected to their 32 bit processor,
Falcons do not.

> Falcons have a socket for a MC68882 coprocessor, A1200s do not!

A1200's have a spot on the motherboard for a FPU. The dealer can install one easily. All 3rd party trapdoor cards have them too.

> Falcons can easily have games with 65536 colours, A1200s do not!
HAM8 uses 262,144 colors. Besides, since when do fast moving games require hi-color? Higher color modes would slow a game down to where you couldn't have smooth action. For slow, strategy-type games, HAM8 is perfect.

> Falcons have a DSP processor 32Mhz, A1200s do not!

So? I don't have a use for one. Why would I want to pay extra for something I would waste? At least C= makes different levels of a system, so you can choose what you want your machine to be capable of, at the price you can afford. There's no high-end Falcon, there's no low-end Falcon. Everyone pays the same, whether they use something or not.

> Falcons have 8 16bit sound channels, A1200s do not!

If you have a use for it, you can easily buy a card.

> Falcons have MIDI in/out, A1200s do not!

That can be expanded as well. Remember, Amigas are all about expansion.

> Falcons have SCSI-II, A1200s do not!

There are at least 3 different SCSI expansion cards available for the a1200. The CSA SCSI card also comes with a 50 mhz 030, 50 mhz 882, and 4 megs of

32 bit RAM. Wonder how fast that would scream, since it never has to deal
with 16 bit RAM? :)

> Falcons have LAN built in, A1200s do not!

A1200's have access to all those PCMCIA options from the PC world. Wanna
wager on how many networking cards are out there?

>
> A1200s SUCK TO DEATH, Falcons do not!

Your wisdom and logic are simply astounding. You have chosen to endorse
an optionless, low-supported, non-existant in the U.S., 32 bit machine that
features a 16 bit bus. This machine WAS designed in the 90's, right?

You seem to have the feeblest grasp of hardware/touch with reality of anyone on the net. Congratulations. I think I speak for both the Amiga and Atari communities at large in saying please shut up. I originally planned on addressing each of these statements, but it has been done a thousand times over, and I think the cro-magnon idiocy of your article speaks for itself.

C= makes a HD drive. Along with several others. If one really needs one, they can put it in. Remember that the 1200 is a low-end machine for those who can't afford the 4000 (which does have the HD drive).

> >>2) no onboard support for a SCSI hard disk standard (although IDE is tolerable)

There are several companies that introduced SCSI cards right after the 1200 was announced, and the CSA card also has a 50 mhz 030 and 882.

> >I think that's a major flaw. Every computer should have a clock, just

>

Heiko, you are really confused. 10% CPU speed more or less applies to substituting a 68010 for a 68000. If you had another Falcon model, that DIDN'T have the crippling 16 bit bus, you'd see the difference. As it is, you have nothing to compare to. Why don't you ask a Motorola engineer to tell you what happens when you put an 030 on a 16 bit bus?

> Ciao, Heiko.

>
> Still, add $$$.

Your 'still add $$$' attitude would mean more if the Falcon and 1200 were
the same price. How much more does the Falcon cost?

>
> Why didn't they put a 1.44 MB drive in the A1200? Any good excuse for C=?

To make the cost as low as possible. Remember, on a low-end machine, that
IS a priority.

>
>
> >: 2) no onboard support for a SCSI hard disk standard (although IDE is tolerable)

There are expansion chassis's that allow 500's and 1200's to use A2000-style
cards. My HD and controller is sitting in one right now.. :)

>
> And why does it need only an '020?

Cost. Cost. Cost. When the time comes that you need more power, you can
expand up to the 50 mhz 030 boards easily.

>
> >low-cost system, and an EC020 is cheaper than an 030 by a respectable

Re: Jaguar Lynx and Falcon

Ack! I should have expected it, but I got quite a few messages. I will send this file to each user that sent me mail, and I will send an extra msg. to anyone whose request warranted more of a reply!

I attended the Atari stockholder meeting Friday June 25. This is from the end of the year report.

Jaquar:
=======

The Company [Atari] is developing a new interactive multimedia console based on proprietary custom semiconductor chips, including a 64-bit RISC processor. This multimedia console is code named "Jaguar."

The video features include 24-bit graphics with up to 16 million colors and a 3-D rendering engine which can manipulate 3-D polygon shapes in a "real" world in real time. The "Jaguar" also has real time texture mapping and can create special video effects. We anticipate the video output on "Jaguar" will be far superior to video games available today and will allow for more realistic simulations for moving vehicles such as spaceships, cars, airplanes, and figures.

The entertainment software for the system will be first available on ROM cartridge.

The sound system is based on a high-speed custom Digital Signal Processor dedicated to audio. The audio is stereo 16-bit CD quality and can be processed from simultaneous sources of audio data. This allows for very realistic sounds to be used during software design as well ashuman voices.

The "Jaguar" will include a 32-bit expansion port which will allow for future connection into cable and telephone networks when such opportunities arise. These also will be a radio processing port for modem use and for connection to digital audio peripherals such as DAT players.

The Company is also developing a compact disc peripheral for the "Jaguar." Software developed for this media can take advantage of lower media cost, capacity (up to 650 MB) and additional flexibility in the area of full motion video (FMV), voice and music. In the future, "Jaguar" will be able to connect a cartridge into the 32-bit expansion port which will allow for FMV playback at VHS quality. The cd peripheral is double-speed and is being designed to also play regular CD audio, CD+G (graphics) and Kodak's new Photo-CD.

My Comments
==========
The graphics were nice and the machine was very obviously fast. The
sound was not yet working (they said it would be done in a few days).
The RISC chip took three years to desing and is being produced by a
major semiconductor manufacturer in the USA. (They wouldn't say who).
The sound DSP is also made by Atari. The price will be around $200.
October/November in SF and NY. December in London and Paris. Rest of the
places in 1994.
(I will buy one if it is out in Jan and costs about $200- it was fairly
cool)
They showed about four games. One, CyberMorph, was excellent. (Sim to
what you may see on a VR headset on a Silicoln Graphics)
Anyhow, spelling errors are mine. Redundant language is all Ataris.
(I.E. proprietary custom - those words seem the same to me!)

Lynx
====

-> Said nothing new. Atari hopes to bring in sales with Jaguar. There are
several dozen games now. Toys R Us stopped stocking due to poor sales.
They will do adds similar to Genenis (I.E. at end of Jaguar add they
may mention Lynx

Falcon
======

-> I am sick of typing. You know enough about falcon. One note, the DSP
in falcon is Motorolla (56000/56001). The DSP in Jaguar is Atari custom.
Atari does not plan to push this computer. Basically for music and such
applications.

Other
=====

Price on LYNX now $79.

Atari stock about 2.5.. (double what it was two weeks ago). Atari did NOT
do a 10 to 1 reverse stock split as they planned when it was at 1.00.

They have a press release for Jaguar as well. I am too lazy to type it.
Maybe later. (I will keep the names of those of you who requested the
info.) It listed these games: Battlezone 2000, Tempest 2000, Cybermorph,
Alien vs. Predator, Jaguar Formula One Racing.

Thats it. Someone (pref. only one!) post this to the comp.atari.advocacy
newsgroups. I wont have time.

Hope it helps --

Mike Draeger (MDRAEGER@SCU.EDU)

>features a 16 bit bus. This machine WAS designed in the 90's, right?

By "Optionless" I'll assume you mean loaded with all those added cost
items available for the A1200. So an Amiga 1200 outfitted with PCM stereo sound,
a SCSI card, a midi port, an internal 80mb IDE hard drive, and 4 meg of
memory, (Let's leave out the DSP for the moment) cost about the same as the
Falcon. So these machines are really price competitive when outfitted
with comparable equipment. These are the things most Atari users want
on their systems.

I'll assume you saw my previous posts discussing the memory access time,
the A1200 comes out faster by 15%, and CPU optimizations, depending upon
instruction mix the 68030 can seemingly fetch and execute instruction
with an apparent 0 clock cycles compared to the 68020 because of the
parallel instruction pipe. If those posts encouraged you to look into
things a little more you'd realize that depending upon what your doing
The Falcon has the ability to out run the A1200, particularly when the
instruction and data caches are enabled on the 68030.
```

So let's drop all this BS because we've beat the horse to death
and we are getting into a circular discussion.

Brian

## 859. A1200 vs F030

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-01 18:25:37 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Jul1.182537.19563@newshost.lanl.gov>
Source record: 22393

Seems to me that there are a lot of rather lame arguments on both sides.

Question: Which to buy, the A1200 or the F030?

Answer: It depends.

1. If you have a lot of Amiga software already, buy the A1200.

2. Conversely, if you have a lot of Atari software, buy the F030.

3. If you have neither, then you will probably end up buying a PC or Mac anyway as _neither_ company is selling many units to brand new users.

The bottom line is that who really cares what you (or I) think? The decision will not be greatly influenced by anyone's comments on the net, but rather by the depth of one's pocketbook, the skill of the salesperson, and the gullibilty of the prospective buyer. Enjoy your "Fujitsu 7800" or whatever brand of machine you settled on and let the rest of the world be damned. Who cares???

We now return you to regularly scheduled flame fest. :)

I hope I am never forced to use an 030 with a 16-bit bus. I have no reason
to use a Falcon, though it does sound interesting.

Certainly, thats what is so infuriating about the limitations it has
now. Making just a few operations multithreaded seems like a trivial
task, and its surprising the OS people haven't done it yet. I guess its
time for a WB replacement. :-)

: How do you plug it in? Will it work if you just throw one in? Or will it
: not fit in the case?

Add it externally; it won't fit in the case.

: Still, add $$$.

Yes. I'll address this later, all at once.

: Why didn't they put a 1.44 MB drive in the A1200? Any good excuse for C=?

Probably expense. The A1200 is positioned to be a low-cost system, in
both production cost and street price.

: >Currently, no solution exists, though one is said to be on the way.
: >Solutions exist for ZorroII/III equipped systems, however.

: Which the A1200 is not, thank you very much.

Correct. Do note, however, that an expansion chassis to allow for Zorro
expansion is destined to exist--just as they exist for their closer
cousins, the A500 and A600.

: Sure. Right. Add $20-$30.

Yup.

: Where does your clock plug in, by the way? (Don't waste your PCMCIA on
: a clock... or even worse, your 32-bit slot on that!)

Neither. You use the "clock slot".

: This is moi's list of A1200 flaws. The Falcon isn't involved in this. I'm
: discussing how much nicer the machine *could have been*.

Agreed. In that case, yes, it is a flaw. Leaving out the PCMCIA slot
isn't wise, but there IS only one 32-bit slot.

: I want a DSP in the machine because it's a plus. When such things become

A plus does not equate with a design flaw.

: And I'd be foolish not to say I'd like to have a powerhouse like a 56001
: under the hood of my "base" machine over the option of no DSP at all.

: (i guess i've gotta drag the Falcon in to this, eh?)

No, not really.

: And why does it need only an '020?

Because the system ships with one type of memory, and one type only: chip. And an 030 wouldn't gain anything appreciable from chip ram, and would cost a great deal more. Shared memory does not performance give.

: Omissions ARE flaws.

Omissions are something one takes in context. If you wish to regard the DSP as a flaw, then you are taking it in the context of another system, which still doesn't give you a flaw in the actual design, merely an omission.

Now, let's say you take the CPU, and place it into a system architected for a 68000. You slap the 030 in, but leave behind a memory subsystem designed around the 68000 cycle, the 68000 traces, the 68000's 16-bit memory path. You have crippled that 030's performance, and designing the various parts of your system that way, ANYWAYS, could be considered introducing a flaw into the design, and not a small one.

: Still, add $$$.

After all that, I forgot my most important point. This gets back down to fundamentalism, and the base architectures.

With money, you can upgrade the Amiga's I/O. With money, you can add 32-bit memory. With money, you can solve all of the problems that you said the A1200 has.

However, no amount of money will make that Falcon access its ST-ram in 32-bits. No amount of money will make that Falcon run at the speed it should within that memory architecture, no amount of money will help you when you upgrade to faster processors, and that speed gets worse.

All of the I/O in the world won't hide the performance hit you take by using that ram at all. And just like the Amiga's chip ram, you WILL use that ram, inevitably.

THAT is what I mean by "fundamental flaws". And if you think they affect your Falcon now, wait until you try using an 040. Then you'll see just how much of a hit you'll take because of the 16-bit blunder that is your ST ram.

: FIXABLE: 32bit Fast RAM for the Falcon. But that wasn't the point...

That would only be true if adding 32-bit ram to the Falcon corrected the
problem with the ST ram. It cannot. And since you cannot AVOID using
that ST-ram, just as you cannot avoid using it on the Amiga, you cannot
correct the problem.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
I would like to see from where you got this number... if it
is an A1200 without fast ram, it's believable, but then just a
things perhaps you don't know: the A1200 with chip ram only runs
(external access) @ 7.14 Mhz whereas as soon as you plugh in fast
ram it runs @ 14.28Mhz. I expect more than that 15% advantage.

Totally doubtfull. The caches in the '030 are not so incredible
in real applications, and the '020 has a cache anyway.

IN THE INTERESTS OF EQUAL OPPORTUNITY, I'M TAKING AN EQUAL OPPORTUNITY TO MAKE AN ASS OUT OF EVERYONE READING THIS.

In article <20uvpm$slc@nz12.rz.uni-karlsruhe.de>, |S| Hermann Samso (S_SAMSO@iravcl.ira.uka.de) wrote:
: AMIGAS 1200 SUCK TO DEATH!!

Falcons are mindlessly crippled machines!!!

: BUY A GOOD COMPUTER, BUY A FALCON!
: Falcons have a 68030 processor 16Mhz, A1200s do not!

The 1200 has a 32-bit bus from computer to memory, the Falcon does not! That falcon may as well have a small, ugly frog as its main CPU, it'll go about as fast!

: Falcons have a socket for a MC68882 coprocessor, A1200s do not!

A1200s can have them added through external expansion.

: Falcons can easily have games with 65536 colours, A1200s do not!

A1200s can use well over 256,000 colors, out of a 24-bit pallete.

: Falcons have a DSP processor 32Mhz, A1200s do not!
: Falcons have 8 16bit sound channels, A1200s do not!
: Falcons have MIDI in/out, A1200s do not!
: Falcons have SCSI-II, A1200s do not!
: Falcons have LAN built in, A1200s do not!

The A1200 has a real expansion bus, the Falcon does not! Two methods of expansion means that you can have all that, and still don't have to sacrifice performance by going with a Falcon!

: A1200s SUCK TO DEATH, Falcons do not!

Heh, yeah right. They rank right up there with the Mac LC, bud. I guess you really can fight bias with bias. Not.

: >>Well, here's the flaws of the Amiga 1200:

Damn my editor, I just wrote a most eloquent response and the damn
thing trashed it.. anyhow.. here goes

Take 2

>>1) no built-in high density drive

No HD drive, ugh... what are they thinking ?

>>2) no onboard support for a SCSI hard disk standard (although IDE is tolerable

I think IDE is adequate, considering this machine is meant to fit into the
'lower end' of computer sales.

>>3) inadequate sound capabilities for professonial music (this is *my* list,
>> so this will vary for others...)

8 Hardware channels would have been nice, but its amazing what people can
do with an 020 :) You might just get 8 nice sounding channels before you
can say 'digital mixer' :)

>>4) no clock (minor gripe? or is it? who wants to pay extra?)

I suggest look at your wrist watch :)

>>5) one 32-bit expansion slot means you have to buy one good board(pass-through
>> would make this irrelevant in one respect, but how to fit multiple cards
>> on the machine?)

I cant see why you would want multiple cards, if you plan to launch a satellite
with a computer you dont buy a A1200 do you ?

>>6) no DSP (as opposed to Atari's "ancient DSP"... any DSP is usually better
>> than no DSP :) )

DSP DSP, everywhere I go I hear DSP. What is it ?
:)

(Flame mode on)

>>7) it is using a 68020 as opposed to a 68030. If they put 32-bit access into
>> it, then why not give the machine a full '030? Did they just want to
>> make sure it didn't copete against the 4000/030? Or was it a design
>> decision?

I was under the impression that the 030 wasn't all that much dearer than the
020. This, IMHO, was commodores biggest error of judgement. I suppose they
were unaware that Linux was being ported to the Amiga, and I know they cant
make execute decisions on a public domain package, but just _imagine_ how
many more A1200 owners there would have been if they knew that in the near
future, that their computer could run UNIX. Im not saying that it the
be all and end all, but geez, wouldnt it be nice :) For the educational
value alone it would have been a boom.

>>I don't want to get in to flaming the OS for the Amiga because while I think
>>certain aspects of it can be improved, if we all had to pick the ideal OS,
>>everyone would surely choose something different... and we'd all debate the
>>merits of OS/2 vs. Windows NT vs. *nix vs. MultiTOS vs. AmigaDOS vs. etc. etc.

Workbench Kicks ass :)
Even on my 1.3 A500 hehehe

My first post was far nicer (*grin*) but I hope this adds to this rather
interesting discussion.

Maybe in the initial surge, but they are selling for approx. $469, now.
Computability recently had an amazing sale, with stock 1200's going for $399.
They sold out in a few days.. :)

> The Falcon with 1MB and no HD is $799 (MSRP) here. The typical configuration
> is the 4/80 model for $1250 (they upgraded the hard drive to an 80MB IDE).

For $1250, you can put together a 4 meg 50mhz 030/882 a1200, with a SCSI
interface and HD. It would seriously smoke your Falcon. :)

A Falconeer brought up the "colors for games" argument, btw..

So you think the Amiga is not capable of serious applications. I'll let you in on a secret, I think playing games is a waste on my computer as well. The Amiga is NOT just for playing games. BTW, would you say the same thing about PC-compatibles? Their games market is exponentially larger than the Amiga and Falcon put together..

Speaking of serious applications, wouldn't you rather run your DTP program in more than 256 colors, if you have 24 bit pictures on the pages?

But if the Falcon's come with an IDE hard drive, isn't it wasted? That
could have been an option, keeping the base model $$ lower.

>
> Get informed you can get a 32Mhz 68030/68882/VME/up to 128 megabytes
> board for the Falcon right now. :)

Get informed yourself. 32mhz is not 50 mhz, and besides that's on top of
the already much higher price of the Falcon. Plus, the CSA board could
also have a 128 meg simm, that is if anyone could afford one. (or if they're
even available yet)
Again, that 32 mhz 030 would STILL have to access some 16 bit RAM, so if
you added 128 THOUSAND megs, it would still bottleneck.

Can you honestly tell me that EVERY Falcon user needed a DSP, midi, LAN,
etc. pricetag added onto their machine? I've never said the things suck,
I've always said they should be options. The majority of the people in
the world just don't have a lot of money. Why not make a machine that's
affordable to the most people, with options for those with special needs
and the money to throw at them? Atari should take notes next time around..

>I was under the impression that the 030 wasn't all that much dearer than the
>020.

Except that they used the 68LC020, which, with its smaller packaging, is probably a substantial saving when you look beyond the price of the CPU to board layout (which is why Atari and Apple have gone for these cheesy 16-bit designs; after all, the CPU costs the same).

> This, IMHO, was commodores biggest error of judgement.

I think it's a good engineering decision, weighing cost against performance and features. What it's not is a good marketing decision, because the buying public is conditioned to look at the CPU only, and care less about architecture. I'd rather own a computer that was designed by engineers than marketdroids anyday. Except that, in the A1200's case, the marketdroids got in _after_ the engineers were finished, and left out the 68881 socket and clock, that had been provided for in the design. :-(

> I suppose they
>were unaware that Linux was being ported to the Amiga, and I know they cant

>many more A1200 owners there would have been if they knew that in the near
>future, that their computer could run UNIX.

It's easy to imagine: bugger-all, I reckon.

Most A1200 owners haven't even heard of Unix. Of those that have, few would want to cram it onto their A1200's hard drive. And, what are you going to do, run Linux in 2MB of chip ram? Any Unix hackers would have to have upgraded systems anyway, so that small section of the A1200 market would likely be looking at an accelerator/ram/scsi board in any case.

I agree. But the Atari guys keep it going. I've TRIED and TRIED to explain the 16 bit bus thing, as well as others, but they just won't let it alone. They just keep pulling more and more BS out their asses about how 'in real-world applications, this won't mean so much,' but like I've told them, I run pretty much applications-only, and my 030 equipped 500 bottlenecks with the best of them. Running a 32 bit processor with ANY 16 bit memory is NOT the way to go...

Yes. See, Amiga owners have OPTIONS. Maybe you don't mind not having a
choice of having added equiptment not everyone will need, but some do.

>
> Its just a basic fact that that the A1200 and the F' 030 are aimed at very
> different markets that seems to be beyond the understanding of the A1200
> users.

Wait a minute. The Falconeers rarely argue about having separate markets.
Then again neither do I. What we've been arguing about is whether or not
the CPU access to memory is good on the Falcon as opposed to the a1200.
This wouldn't matter much for games, but it makes all the difference in the
world for APPLICATIONS AND WORK. Getting the job done, and quick. That's
what it's all about. In which case the a1200 has the decisive edge,
because for sheer, getting-the-job-done-fast power, a 16/32 bit machine
is not as good as a 32 bit only.

>
> Actually it is quite annoying, super fast graphics and sprites they say
> are *soooooo* important that any machine that does not match is crap and

We don't call the Falcon crap, we call it limited, poorly-designed, etc.
It has some nice features, but it misses on the memory system, and that's
what's important in terms of computing power. Remember, 'twas not I
who posted that ""highly informative" "A1200's SUCK TO DEATH!" post.

> then when someone points out that the A1200 has a pathetic range of I/O
> and backup options they say that these things are not important.

It doesn't have a pathetic range of anything. It is simply optional, so
that certain people who need something can customize and specialize his
machine to suit his needs.

>
>
> The F' 030 vs A1200 debate is kind of stale and useless, for me the

Seems so, at least parts have to be rewritten due to speed problems
(the desktop still works in supervisor mode unneccessarily). Eric
Smith is working on this, and perhaps Atari will even drop the DR C
and take GNU C to compile the next versions of MultiTOS.
Don't forget that it IS a 1.0 version, and it works, at least.

What kind of software is available for Falcon? I need
terminal-emulator (like NComm), text-editor (CygnusEd or TurboText),
C-compiler (SAS or DICE), Lha/Zip-archivers, Point utilities
(Point Manager & Trapdoor), Drawing program (DeluxePaint IV) and
some other utilities in everyday work.

If I'll go and buy Falcon, could I find the same programs and
are they even better than Amiga ones?

serious applications? In a non-multitasking environment?? :)
Do you mean to say you call it serious when it can't access more than
256 colours? Come on, even the Solbourne workstations i use can use more
than 256!
ever ran an application on a 1024x512 screen in 265,000 colours, Now
THAT is serious! :)

Amiga> |> we can have 265,000 colours in ANY resolution!
Amiga> |> Your 65536 col. mode is 320x256 only!! ha ha ha ha

> At least it's there :)

Out built-in IDE is as fast as the Falcons SCSI implementation at
read/writes due to the 32-bit circuitry. True, the IDE is 16-bit, but
the custom chip sorts that out. Bye the way, A1200 treats it as a SCSI. :)

> Get informed you can get a 32Mhz 68030/68882/VME/up to 128 megabytes
> board for the Falcon right now. :)

Only 32MHz? :)
Anyway, 128MB SIMMS are not (widely) available yet. And 32MB SIMMS cost
1500 pounds roughly!
PS What does VME stand for? :)

> |> PS It was soooo obvious the you wanted to be flamed. sad really.
> |> Take my answers and cry into your 500 quid receipt for a machine bought
> |> that could not use any resources available.
> |>
> |>
> What for you speak of you A1200 this way?
> Brian

Im not! :)
My A1200 ONLY cost me 350 pounds! :)

[crap .sig deleted :)]

2 more points.

1) True, Falcon does come with MIDI (as do all Atari) but what is the
point if its non-multitasking??
On my A1200 I can be pumping out a tune through the MIDI interface(along
with several choice Internal .8vsx amiga samples :)) and when a glitch
appears in the tune [composing at 140 bpm does have its problems] I can
just edit the tune "on-the-fly" whilst it is still playing! either in
the playing program or via loading up another copy of the program and
Arexxing the file or loading up the same tune into another copy and
saving it. Naturally, all this would be done whilst listing my hard-disk
tunes directory to see what other tunes I have - whilst formatting a
1.44 MB floppy for my A4000/030 owning friend, so that he can have a few
tunes of mine. naturally, the change to the tune would be logged down in
a document that is typed into Wordworth2 (which is hiding on its own
screen behind my 1024x512 256 colour workbench which has a GIF file of
Cindy Crawford being displayed in the bottom right corner!).
he could then read the document whilst playing the tune.
Now, THAT is serious application usage!!

2) A1200 has PCMCIA technology, Falcon does not! :)

By the way, due to pricing, this Flame is totally wrong.
It SHOULD be
A4000/030 v's Falcon

NOW try arguing! :)

From Alan - a reply is appreciated ;-)

Well, let's put it in terms you can relate to... :)

When you chose the Amiga, you also claimed you chose it because of the
high performance of the system due to custom chips included as part of the
system.

I'm sure that if someone said that you could put the Copper, Paula, Denise,
etc... chips on the 32-bit expansion slot and they released a machine with
minimal cabilities out the box, you probably wouldn't see this as a
design advantage.

So enjoy the fruits of C='s labors, and use your custom chipset. And were
a 56001 DSP among those custom chips, I'm sure you'd consider it an
advantage over a system that has no DSP.

>

With a LOT of money, you should add. And you can't solve *all* of the
problems so easily.. and you can't make the devices standard for your base
model of machine, making it the LCD for which developers will design for.

I'm sure having a feature-packed machine as the lowest common denominator
for your new line of computers is a plus when later s/w development will
look at it.

For example, a lot of 1200 s/w is probably going to be distributed on d/s
disks because they will not assume you have a HD drive.

Also, 1200 s/w may not take advantage of the presence of a DSP when/if C=
gets around to releasing one because not everyone will own one. Every
application cannot assume it is present because of this.

This goes for the sound inputs (voice recognition and digital audio recording
s/w can assume they exist ont he Falcon... how to access that 3rd party
solution?).

Ad infinitum, ad naseum.

The point I'm making is that even if you add all these things on to the A1200,
they are NOT standard hardware, and the price the A1200 pays for it will be
that software will not be developed for the Amiga that will assume the
presence of such devices when they do not exist on evry machine. The only
exception to this would vbe in the case of the SCSI-2, which would need only
a driver.

True, but unless the CPU spends a fair portion of its time in chip RAM,
the performance hit will be less noticeable than you might think.

And consider this: once the ST feeds, say, the 56001 DSP a program and data,
it runs off at 20MIPS, and independently does its work internally and in
chip RAM.

The 68030 will be getting maximum performance out of TT RAM.

This occurring while the other custom chips are also functioning in a similar
manner.

All things being considered, you might want to consider the fact that the
system's chipset has 32 bit access to RAM (something we still haven't heard
conclusively about on the A1200 yet), and with the inclusion of a burning
fast DSP as well as enhanced custom chips, it's going to deliver solid
performance and features.

> (external access) @ 7.14 Mhz whereas as soon as you plugh in fast
> ram it runs @ 14.28Mhz. I expect more than that 15% advantage.

Well the calculations are very simple:

Description A1200(Stock) A1200(FR) F030
Bus speed 7.14mHz 14.3mHz 16mHz
Clock cylce 140ns 70ns 62.5ns
number clocks/32bit access 3 3 4 (2 syncronous accesses)
Elapsed Time 32bit access 420ns 210ns 250ns

So actually I was assuming the base A1200 had a 14mhz 0 wait state bus, so if
you really have a 7Mhz bus, the base Falcon would be 40% faster on a 32 bit
memory accesses. Thank you for this IMPORTANT piece of information!

So, is it poosible to remove the chip ram, and replace it with fast ram?
If so what does it cost?

Brian

Ok, but still... There ARE still parts of the OS that are NOT
multitasking, and that's not really good... You could expect
that an OS released in '93 should have full multitasking, at
least an OS that claims to be Multi... But maybe it's just a
marketing decision; Atari wanted the machine out as soon as
possible and therefore didn't let the developers do their work.

You'll get the undoubtably most error free vt100 emulator for the falcon
as for any atari computer, in comparison to any other vt100 emulator on
other platforms. Comparing CoNnect to NComm will make you wanting to have
an ATARI ;-)))

Am I able to use different character-sets with CoNnect? I need
IBM-, ISO- and SF7-sets everyday. And there should be full
support for scandinavian characters in terminal-emulator.
I have not noticed any bugs in the VT100-emulation of NComm,
so it's error-free enough for me.

BTW, What are the advantages of CoNnect compared to NComm?
Does it transfer data faster when downloading with ZModem or what?

> Elapsed Time 32bit access 420ns 210ns 250ns

I thought that the '030 wasn't able to do sync. access to 16bit memory... So it might be:
clocks/32bit access 6
ns/32bit access 375

> So actually I was assuming the base A1200 had a 14mhz 0 wait state bus, so if
> you really have a 7Mhz bus, the base Falcon would be 40% faster on a 32 bit
> memory accesses. Thank you for this IMPORTANT piece of information!

Is this correct? Does the A1200 really have a 7MHz bus??? I thought that the bus was 14MHz and that ChipRAM accesses was simply bounded to every other DMA slot, and that waitstates was inserted to align the access to 280ns boundarys. The cycle length would then be somewhere between 280ns and 420ns, but I might be utterly wrong here thou...
*IF* I'm correct here, then that would make the A1200/F030 access time ratio somewhere between 0.75 and 1.12. Ie the machines would be about equally fast in the stock A1200 case. If FastRAM is added to the A1200 it would (depending of the mix of Chip/Fast accesses) up to twice as fast as a stock A1200 (*BEST* case possible...)

Is there anyone who is 110% sure of the inner workings in A1200/F030 out there, so we at least can get all the facts straight...?

> So, is it poosible to remove the chip ram, and replace it with fast ram?
> If so what does it cost?

Well... I wouldn't recomend doing that... You might unplug all `ST-ram' in a F' to get the idea of what would happen...

I'd disagree with that point. Many starving student types (myself included)
would have love to own an A1200, but can't afford it. Now, if I were able to
run Linux on the beast, however limited, after adding a cheap IDE drive, well,
I'd find the money. As it stands right now, I'm computer-less until I graduate,
hoping that the 5000 or whatever it is gets itself released a few months before
I find myself working a real job. But it's a shame that I'm going to have to
wait that long just to run something Unix-ish. And Amiga-ish for that matter.

You really shouldn't be calling the Falcon a crippled machine. I think
the more correct term should be 'computationally challanged'!

What was this I saw about the A1200 running memory access at ~7 Mhz _out of
the box_? So you can fix that by adding chip ram? Why is it you need to
add soooo much to the A1200?

Is the 16 bit access in the Falcon really so terrible for a home computer?
Will it really make such a big difference if some operation takes 30 secs
instead of 15 secs to complete? Is the average user really gonna suffer
by the 'yet unproven' affects of this 16 bit access?

How many 386 and 486 _SX_ type systems have been sold with similar crippled
... I mean computationally challanged ... architectures? I suppose all
those people are just kicking themselves in the behind because their computer
is useless.

Oh well, flame on...

>
>A badly disabled 16MHz 030! It resides on a 16-bit bus.
>The 32-bit 14Mhz 020 in the A1200 is only 1/3 slower

Hold on... so is this to say the 14mhz 68020 on the A1200 is indeed, out of the box, slower than the 16mhz 68030 on the Falcon even with the 16-bit data buss argument we've been having in this newsgroup?

I'd love to sit here and gloat if the Falcon is indeed faster, but I would doubt that there exists a good, fair, benchmark between the systems that would be able to prove this at the moment. Of course, if someone wrote one already, I'd love to hear the results....

(interestingly enough, one thing I was wondering about in regards to the choice of Atari to use a 68030 was that they might have preferred to have memory protection due to MultiTOS standard on their base machine... and also, the advertising one-upsmanship of saying "030 power!")

>
>> Falcons have a socket for a MC68882 coprocessor, A1200s do not!
>Ah-ha. sorry, but they do!! Its about 1.2 cm away from the CPU.
>check before you speak!

I'd heard it didn't have a dedicated socket. But now you say it does. Does it?

>
>> Falcons can easily have games with 65536 colours, A1200s do not!
>yes they can. VERY SLOW ONES. Due to the A1200 have custom graphics
>chips, we can have 65536 colours flying around too!

Well, it's not like the Amiga is the only one with custom graphics chips.
(In fact, saying custom graphics chips like it is a "good thing" without
qualifying what is so good about the chip is kind of... vacuous)

>
>256 colours is just a plain boring mode (IN ANY RESOLUTION)

Well, if you were weaned on an Atari 2600 or Intellivision early in life,
you'd have greater respect for even 16 colors! I remember the days when
I had to trudge 5mi. to use a VIC-20 in the snow... uphill... both ways! :)

>we can have 265,000 colours in ANY resolution!

>Your 65536 col. mode is 320x256 only!! ha ha ha ha

Well, I wouldn't laugh if I made a boo-boo like that. :) You mean
320x480, don't you?

>
>> Falcons have a DSP processor 32Mhz, A1200s do not!
>A crap Motorola 56000. Yes.

This is the funniest argument I've ever heard in my life... it's like saying
that having nothing is better than having something. Well, wait and wait
and wait, and I'm sure when yours is available, it will be very nice and
suit your needs. :)

>An AT&T3210 which is able to totally whip ass with over 30MIPS!!!

Yes. It's a nice DSP. And I like the floral arrangement around it. Is
it currently shipping?

(Was it officially announced, also?)

>All techies that I have talked to are very impressed by the AT&T...
>its used in workstations that require POWER!
>

Hmmm. Does this mean the SGI and NeXT had no power? They relied on the
Motorola 56xxx series of DSP.

(We used to have Ariel 56001 DSPs in our comms lab where I worked at on
Sun SPARCs, and I'd hazard a guess that the 56001 is no slouch for real
world use... although it is not the newest technology any more)

>> Falcons have 8 16bit sound channels, A1200s do not!
>tryed playing them all at once yet? Big samples?
>our DSP could supply 12 16-bit channels in stereo.

Our DSP?

You got one? Wow! It's not even available! :)

>But hey, Amiga samples are much clearer due to Paulas 50Mhz DAC.

A 50mhz DAC? Clarity is a combination of both sample rate and sample
resolution. Not sure what you meant there...

>
>> Falcons have MIDI in/out, A1200s do not!
>Any amiga owners can CHOOSE which midi interface to get
>(thats if they want to use it for MIDI)

Well, that's very nice. I hope they enjoy spending the extra money. :)

>I personally have a MIDI interface with thru-port, 2 out 1 in and 2
>thru.

Yes, and I have one out/thru and one in, and a larger base of software
to choose from to drive my poor little ST.

(Of course, I could also add 3rd party ports to add to my MIDI power, but
I'm not gonna do that until I get noticeable time lags in my gear... or
so much gear I run out of MIDI channels!)

>
>> Falcons have SCSI-II, A1200s do not!
>Oh dear. They've called it SCSI-II but it isn't full implementation.
>Plug in a SCSI-II drive and it will be used as a SCSI-I
>HARDLUCK.
>

Got proof of this?

>Anyway, a CSA twelvegauge will provide
>1) 50MHz 030 with 50Mhz 68882.(which will blow away a Falcon)

That surely would. :)

>2) a 10MB/sec SCSI-II port

Ooooooooooooh! :)

>3) up to 32MB of RAM (isn't 16MB the most the Falcon can have? :) )

Well, nah. We have a board that lets us go to 128MB, but don't let that
mess up your groove. :)

>All for less than the price of a 4MB falcon :)
>

I'm impressed. But...uhhh... you forgot the DSP, the Localtalk ports,
the 16-bit sound, and the partridge in a pear tree.

>> Falcons have LAN built in, A1200s do not!
>Oh yes...that.
>1) it uses the DSP - so there goes your DSP usage

The LAN uses the DSP?

Huh?

>2) Are all Falcon owners gonna use it? - specialist usage only.
> anyway, LAN's suck. Better to have InterNet port :)
>

Well, ummmm... right. :)

>
>[DSP stuff deleted - AT&T have contract with C= meaning CHEAP chips]

Ok, so the Amiga DSP is forthcoming then, and announcements & agreements with AT&T are done. What is the time frame for it shipping, how will it be integrated to the a1200 (via the 32-bit slot?) and what provisions are there for people who have upgraded already to, say, the CSA 50mhz board, if they wish to add the DSP unit?

>

>read/writes due to the 32-bit circuitry. True, the IDE is 16-bit, but

The Falcon has 32-bit access for custom chips to the RAM, so if the DMA engine for the hard disk is likewise 32-bit, then... it's the same, right?

>the custom chip sorts that out. Bye the way, A1200 treats it as a SCSI. :)

Now, that's interesting.

So how does the A1200 treat a SCSI drive added via a SCSI adapter on a board? Will you have two sets of SCSI devices to access from?

>
>> Get informed you can get a 32Mhz 68030/68882/VME/up to 128 megabytes

>
>Only 32MHz? :)

Hey, 16mhz is tolerable... :)

>
>1) True, Falcon does come with MIDI (as do all Atari) but what is the
>point if its non-multitasking??

They do multitask. MIDI ports can be piped through several applications
Unix-style. Whether they can do this in a timing critical situation is
going to be interesting to see... I doubt it on a low-end machine like
the Falcon.

But it's there. :)

>On my A1200 I can be pumping out a tune through the MIDI interface(along

>he could then read the document whilst playing the tune.
>Now, THAT is serious application usage!!

Wow. I'm impressed. But...ummm... I would say that I'd never consider
using the Amiga sound chip for composing on (I'm spoiled.. I got a decent
MIDI rig, ok?) so I wouldn't need that. Kinda the way everyone with an
A1200 claims that all the neat ports on the Falcon aren't needed. :)

I'm using Dr. T's OMEGA so editing while I play is no problem at all.

I have never brought up the file selector while editing a tune... I would
think it is very hard to edit note data with the keyboard and mouse
and still be attentive to a directory listing... :)

I have STeno and GEMview loaded as DA's on my lowly Mega ST 2, and I
can edit a file (although I lack the beautiful inter-app comms of
Arexx, eh) and watch Cindy Crawford.....

This is all on a lowly 16mhz 68000 Mega ST 4.

:)

>
>2) A1200 has PCMCIA technology, Falcon does not! :)
>

That's very nice. :)

>By the way, due to pricing, this Flame is totally wrong.
>It SHOULD be
> A4000/030 v's Falcon

Well, if we wanna argue prices, we could argue 486/DX266 vs. both of them,
and I think, just maybe, the 486 might win. :)

Sure - this is no problem at all.
CoNnect is a complete vt100 emulator and things like this are only the
basics of vt100 ;-)

> I have not noticed any bugs in the VT100-emulation of NComm,
> so it's error-free enough for me.

try to run vttest on NComm and CoNnect - you will see the difference ;-)

> BTW, What are the advantages of CoNnect compared to NComm?

I don't know NComm very well, but I know lots of jalous NComm users ;-)
I may give you some examples:

high baudrate support: up to 153600 baud on Falcons
Using several ports at one time in differnt windows
Very large context sensitive hypertext online help
supports vt52, vt100, vt102/ansi, vt220 and tektronix graphic
internal (very fast - see below) zmodem.
supports the ZyXel Voice mechanism. -> answering machine.
unix-like built-in shell which is able to learn shell-scripts
and lots of other small features... ;-)

> Does it transfer data faster when downloading with ZModem or what?

well if you think 14000cps (characters per second) on a TT or falcon
is fast ... ;-)))

Wolfgang

That's good!

> > I have not noticed any bugs in the VT100-emulation of NComm,
> > so it's error-free enough for me.
> try to run vttest on NComm and CoNnect - you will see the difference ;-)

I don't own any, I believe in you. But as I wrote, it
has not caused any harm for me in the real work.

> high baudrate support: up to 153600 baud on Falcons

NComm has a support up to 115200 baud. I know one modem which
uses it, but in the real world there is no need for higher
baudrate than 38400. A1200 w/NComm will handle that very well.

> Using several ports at one time in differnt windows

If I'll buy another modem, phoneline and multiple serialports,
I could open multiple NComms. :)

> Very large context sensitive hypertext online help
> supports vt52, vt100, vt102/ansi, vt220 and tektronix graphic

I need only VT100 and V220 emulations. NComm for the VT100 and
HandShake for VT220 (need for that is once in a month).

> internal (very fast - see below) zmodem.

Internal is not updateable. :(

> supports the ZyXel Voice mechanism. -> answering machine.

I don't own the ZyXel-modem... :)

> unix-like built-in shell which is able to learn shell-scripts
> and lots of other small features... ;-)

NComm has a very good script language which is used f.ex. by
ReadMail and NComm Host. I think it's good enough for me..;)

> > Does it transfer data faster when downloading with ZModem or what?
> well if you think 14000cps (characters per second) on a TT or falcon
> is fast ... ;-)))

With 14400bps Supra V.32bis modem you can get theoretically
1740cps speed when transferring .ZIP/.LHA-files. I have got
the speed of 1710cps with NComm by using baudrate of 38400 and
1690cps with baudrate of 19200.

(Formula: Unpackable data with 2400bps and V.42bis goes 290cps,
with 14400bps and V.42bis: 6x290cps=1740cps.)

I think I'll stay with my Amiga and NComm. There are another
terminal emulators available for the Amiga which can do many other
things than NComm. Someone may need them, but I have no use for
the features they offer.

What about my another needs like text-editor, C-compiler etc.?

'Flip', I have to agree with you :-) A DSP, even the 'old' 56001
is an advantage and is very nice to have. I don't know FROM WHERE
people think that is not as nice or doesn't help as much. Having
one can kick butt!

But to be fair, the A1200 cost less... if cost is no problem,
let's compare the Falcon against an A4000 '040.

Yes it is IMPORTANT. But I think you are missing something somewhere.
I have already had the experience of having a 68030 talking to 16-bit memory
(CSA mega-midget racer, disabling the 32-bit memory on my old A500) and
it slows down like hell! IT'S NOT 15% DUDE, and I'm talking about
REAL MARKS HERE.

|>
|> So, is it poosible to remove the chip ram, and replace it with fast ram?
|> If so what does it cost?

Nope, but then you get a 68881 FPU with 2 megs fast ram with a clock
for only $199. This price is still way below the Falcon's and you get
an FPU.

I'll definitely agree with you there... and I will even censor myself by saying that until software comes out en masse to take advantage of it, it will be under-utilized, but as it is in Atari's "base system" and this will be the model to write for, I expect future software to take full advantage of it....

>let's compare the Falcon against an A4000 '040.
>

That's true. For $500, you can have an Amiga 1200, but no Falcon at all. So I guess at that price, the A1200 wins. :)

Computer vs. No Computer

:)

As for the A4000... the main reason I personally compare the A1200 to the F030 is because they are the LCDs of their product lines... although in the real world, a buyer might decide to compare the F030 to the A4000.

I'm curious as to the "real world" street prices on the A1200 and 4000/30 or 4000/40. Also, are they using the LC040 or the full version of the 040?

(I ask because the Centris 610 w/ 68LC040 is only $1229 around here in a 4/80 config... now... that's Falcon prices. If it weren't for the DSP and additional built in coprocessors for video and sound, I'd personally say this Mac kills it...)

I *do* fully expect this Centris to slaughter both machins in the marketplace though. :)

>REAL MARKS HERE.

One thing that might possibly affect this is the speed of the built-ni RAM on the A500 you installed it in. For example, ST computers ran fine on 120ns RAM. I would hazard a guess that if the A500 were using similar speed RAM, it would suffer from having slower memory accesses than a machine using, say, 80ns RAM.

(in fact, Fast Tech has a board out for Atari STs that lets us break our "4MB barrier" on older STs which also increases the speed of the RAM, which gives a *slight* boost in system performance... )

: With a LOT of money, you should add. And you can't solve *all* of the

Not a lot; 400 bucks can put you beyond the Falcon's capabilities by
several megahertz, several megabytes, and give you SCSI to toy with.

: problems so easily.. and you can't make the devices standard for your base
: model of machine, making it the LCD for which developers will design for.

True. Then again, your DSP is a one-program, one shot deal, so that'll
likely cut down on how often it is developed for. As well, the Amiga's
market is larger, which means that it is more likely that Amiga users
will get programs that take advantage of more advanced systems.

: I'm sure having a feature-packed machine as the lowest common denominator
: for your new line of computers is a plus when later s/w development will
: look at it.

Agreed. But having such a small number in that lowest common denominator
isn't going to do much to change the amount of software development
done.

: For example, a lot of 1200 s/w is probably going to be distributed on d/s
: disks because they will not assume you have a HD drive.

Correct. But this has little impact; if you're using a system with a HD
drive, it very, very, VERY likely came with a hard drive, and they'll be
expecting you to use THAT. And MANY 1200 systems are shipping with them
as well.

: Also, 1200 s/w may not take advantage of the presence of a DSP when/if C=
: gets around to releasing one because not everyone will own one. Every
: application cannot assume it is present because of this.

A DSP isn't something that every program needs; it is likely that such
things will have applications geared specifically for it that integrate
into the rest of the system. Voice recognition, modem emulation, and
others are among this.

: This goes for the sound inputs (voice recognition and digital audio recording
: s/w can assume they exist ont he Falcon... how to access that 3rd party
: solution?).

The Amiga is a multitasking system; to add functionality, you simply
integrate it. Application software WILL exist for the DSP, that much is
known.

: The point I'm making is that even if you add all these things on to the A1200,
: they are NOT standard hardware, and the price the A1200 pays for it will be
: that software will not be developed for the Amiga that will assume the
: presence of such devices when they do not exist on evry machine. The only
: exception to this would vbe in the case of the SCSI-2, which would need only
: a driver.

A curious thought. It makes me wonder the wisdom behind releasing a
1-megabyte Falcon. That WOULD be your lowest common denominator, a 1 meg
Falcon without a HD. Interesting solution.

Well, internally and in its own little segment of RAM that it can
access. Saying that the 56001 can access all of the ST ram would be a
mistake.

: The 68030 will be getting maximum performance out of TT RAM.

Correct.

: This occurring while the other custom chips are also functioning in a similar
: manner.

Correct. After all, that's what we're used to on the Amiga. However,
being familiar with this, we're all painfully aware of just how much
32-bit access helps when hitting chip ram--remember, we've lived with
this situation before. Just ask any A2000 accel. owner with an A3000 or
greater--we all know. Any time you update ANYTHING on the screen, you're
stepping down. Resolution affects the speed at which you do that,
additionally. On top of that, you've got all of the other things that
you need to access chip ram for.

Yes, it isn't often, but it's often enough to make a NOTICEABLE hit when
using an 030-accellerated 2000 and a full 32-bit 030 3000. Both have
full 32-bit fast-ram...

: All things being considered, you might want to consider the fact that the
: system's chipset has 32 bit access to RAM (something we still haven't heard

Perfectly aware of that.

: conclusively about on the A1200 yet), and with the inclusion of a burning

The chipset accesses it in 32-bits, yes. The blitter only deals with
16-bit sizes; however, Lisa (the graphics chip) deals with 64-bits at a
time, using page-mode in chip ram to get it in one shot. So, in effect,
it gives twice the bandwidth that a non-page/SC setup would.

: fast DSP as well as enhanced custom chips, it's going to deliver solid
: performance and features.

None of which can help the CPU, the mainstay of the real work that gets done on any particular system.

Well, why not buy a 486 with OS/2? What makes a cool OS with fast response?
Doesn't a NeXT do that, too? What about an SGI?

There's a lot of machines that would fit that description, and the clones
with OS/2 are even in most people's price ranges now.

Well, the only thing you have a gripe with on the Falcon that can even be
considered substantial is the 16-bit access to RAM which, depending on
who is doing the benchmarking in this discussion, has the Falcon either
15% faster or the A1200 up to 50% faster.

>And I do enjoy the fruits of my, and C='s labors, and am happy to do so.

Can it really? There's a lot of catching up to do, and I'm sure you're not
getting *everything* the Falcon offers for just $400 more.

I am familiar with the CSA board that has been mentioned, but there is still:

no DSP
no LAN capability
no 16-bit audio

To be completely fair, it has to be recognized that a 50mhz 68030 will
assuredly toast the 16mhz '030 in an unexpanded Falcon.

>will get programs that take advantage of more advanced systems.
>

Market size has little to do with the sophistication of an application. I'm
sure there are far fewer NeXTs in use than Amigas or STs, but the applications
designed for it are quite advanced.

As for the DSP, using NeXT as an example, I do not see where this caused
a dearth of applications that used this resource for them. If we had
seen something like this happen on the NeXT or SGI, I'd potentially agree,
but this particular DSP has been used on multitasking machines before, and
in the case of the NeXT, I can personally say I've seen many applications
take advantage of it.

Also, although the Amiga's market is larger, I am not totally convinced it
will be a market that will flock to buying DSP expansions and the like unless
there are clear benefits for the end user. That being the case, if the DSP
doesn't sell to the A1200 owners who claim they don't need one to experience
computing bliss, then... there will be little or no DSP support, regardless

of the impressive specs of the AT&T 3210 DSP.

The only way to make serious headway with it would be to include it on a
new system, and offer an upgrade for 1200/4000 owners. But how long would
it take to build that kind of support?

Tools, bindings, etc.. exist NOW for the Falcon programmer who wants to write
applications for the 56001. Not to mention the fact that the machine has the
chip in it NOW.

>: For example, a lot of 1200 s/w is probably going to be distributed on d/s

>as well.

Well, it does when you go to install the application. :) Lots of disk
swaps. :)

Also, if we fall back into the old situation with many copy protected apps
(usually games), some do insist on being run from floppy, and that also
means more disk swaps. It's a matter of convenience, i guess.

One thing to consider is that most DOS and Mac users are porting data between
machines with 1.44MB disks. Because the A1200 lacks one built-in, out of
the box, it would be unable to read those disks despite having the ability
to handle multiple file systems like Atari's MultiTOS.

>

>others are among this.

That's true. But these are applications that will be in greater abundance
on the Falcon than on, say, the Mac LC III, because the hardware is THERE
to do it.

(Actually, I cannot flame the Mac, as they have been moving towards integrating
sound input into the system for voice recognition with the advent of their
desktop mic system... and a DSP is not *required* for voice recognition, but
it surely is more suitable for the task (dealing with a stream of data) than
a normal CPU...)

Yes, but if there is a 1:10 ratio of A1200 DSP apps to Falcon DSP aware apps,
then I would say that the Amiga DSP would be an under-utilized and hence,
not quite as useful or flexible.

(However, one great application would redeem it... sheer numbers of apps don't
make the machine... otherwise, we'd all have PCs... :) )

>: The point I'm making is that even if you add all these things on to the A1200,

Well, I do know that no 1MB Falcons have shipped as of yet in the USA. So
the relevance of that is still up in the air until such a configuration
ships.

I would say that the people who buy the 1MB Falcon no HD are like the
people who buy A1200s with 2MB of chip RAM and no HD... they are likely
to upgrade to something else that is more cost effective soon.

Also, consider this... even the 1MB Falcon has the facilities to use all of
its custom hardware and DSP, and if used under the single-tasking TOS 4.0
and not MultiTOS, it might even (gasp!) be comfortable for someone whose
needs are minimal.

But this is all speculation, and until such a configuration is for sale in
America, it would be inappropriate to speculate on the impact of that.

Well, yeah, but as we all know in the industry, things get cheap quick.
In 2-3 years, a high capacity SCSI-2 drive that is $1500 now will be
quite affordable... probably $500-$700.

Also, I remember seeing a NEC double-speed CD-ROM that requird SCSI-2.
I doubt that runs off of IDE.

Maybe because when he bought his Amiga, OS/2 2.0 wasn't available?

|> Doesn't a NeXT do that, too? What about an SGI?

NeXT: Cool OS yes, quick response no.
As for SGI.. cool OS no, quick response yes? ;)
(The real reason for not SGI is probably the price, although he didn't mention this...)

|> There's a lot of machines that would fit that description, and the clones
|> with OS/2 are even in most people's price ranges now.

First, he gave reasons why he _chose_ the Amiga.. as in past tense.
As for OS/2... I wonder if its popularity will be damaged by NeXTstep. (Not that this has anything to do with the current topic of debate ;)

|> >And when the time comes that I need or want a DSP, you can bet that I'll

|> >that isn't going to be a 56001.
|>
|> Well, I'm sure that you're saying this totally objectively. :)

Well... all he said was that the 56001 wasn't the BEST one for most jobs.
Which is probably true.. just put a 96001 against it for all jobs. :)

Francis

'>As for OS/2... I wonder if its popularity will be damaged by NeXTstep.
'>Francis

Could be, but the hardware requirements for it are pretty steep. I
read somewhere that it needs a bare minimum of 16meg of ram and 120meg of
HD space. Although, OS2's requirements are pretty steep to a lot of people
also, at least their not that bad.
Besides, is NeXTstep capable of running DOS and Windows software as well
as OS2? I really don't know that much about it, thats why I'm asking. Does
it have something like OS2's boot manager, so if it doesn't run DOS or
Windows you can at least boot up a DOS partition?

I've tried to use emacs and vi using Ncomm and the result was awful.
If NComm really is the best vt100 emulator on an amiga the amiga is
useless for me working on Unix or VMS hosts.

> NComm has a support up to 115200 baud. I know one modem which
> uses it, but in the real world there is no need for higher
> baudrate than 38400. A1200 w/NComm will handle that very well.

In reals world there are direct lines which can run on higher speeds
like 38400. Transferring files with 14000cps to my other computer is
a wonderful thing - much faster than using disks ;-)

>> Using several ports at one time in differnt windows
>
> If I'll buy another modem, phoneline and multiple serialports,
> I could open multiple NComms. :)

This is a real difference. Using one program for many ports or having
several programs running, wasting scheduler time and memory. And you'll
need slow interprocess communication to transfer selections from one port
to another. Here in germany sysops like using connect to watch their atari
bbs on the midi port, or their DOS bbs using connects doorway mode while
beeing online in another box.

> I need only VT100 and V220 emulations. NComm for the VT100 and
> HandShake for VT220 (need for that is once in a month).

You only need. OK that's fine to hea. But up to now, you seem to agree
that the atari offers a better terminal emulator, right?

>> internal (very fast - see below) zmodem.
>
> Internal is not updateable. :(

Oh ;-) Of course connect offers you various possibilities to work
with all kinds of external protocols.

> 1690cps with baudrate of 19200.

Whats about direct lines, isdn or telebit worldblazer text downloads.
You could be abe to use much more than 1710 cps.

All you say now is - you don't need it. Might be. Other Amiga user are
very keen on getting a port for their computer, which will not be available.
But I think we agree, that atari offers better terminal emulator than
your systems. And CoNnect is quite cheap: 60DM shareware fee coming with
a 140pages manual.

> (Formula: Unpackable data with 2400bps and V.42bis goes 290cps,
> with 14400bps and V.42bis: 6x290cps=1740cps.)

Fine. You always forget direct lines and packable v42bis transfers. Even
the latter allow you to get 5000cps with the online time saved for lharcing the
data.

> What about my another needs like text-editor, C-compiler etc.?

Text editors? Lots of powerful ones. What do you need? A simple ASCII-Editor or
text processing systems. And C-Compilers? Lets take PureC (ANSI).
Producing really good code (can sometimes even compete to gccs results but
has very fast turn-around times). Includes very powerful source-level
debugger and a very easy to use profiler.

Wolfgang

On the A1200, the custom chips work like this: Alice, which operates
as the bus controller for CHIP RAM, as well as housing the blitter has
a 16 bit data bus, but directs 32 bit accesses as well as double CAS
accesses on this bus. Lisa, which is the display custom chip has a full
32 bit data bus and can use double fetches to grab 64 bits in one CHIP RAM
bus cycle.

>Elapsed Time 32bit access 420ns 210ns 250ns

You're confused. I won't get into the other problems with what you have calculated above, but I will point out one very important one: The Falcon does not use 2 clock synchronous bus accesses. Let me explain; the 68030 has 3 basic modes of bus operation: Synchronous using *STERM, Synchronous using *DSACKx, and Asynchronous. The only mode to offer 2 clock bus accesses is Synchronous using *STERM. The Falcon cannot use this mode, as it does not allow the use of the 68030's dynamic bus sizing feature, and thus any memory being accessed in this fashion is required to have a 32 bit port. The other two modes, Synchronous using *DSACKx and Asynchronous both have a minimum 3 clock bus cycle. The only real difference with these is that in the synchronous *DSACKx bus cycle termination signals are synchronized with the clock, whereas in an asynchronous bus cycle these timing requirements do not exist.
With all this said, the 250ns time for a 32 bit bus access above is incorrect. If the Falcon is using a synchronous bus, it can only be using the mode utilizing the *DSACKx termination signals. This has a minimum 3 clock cycle time, and thus the time really should be: 6 clocks for a 32 bit access @ 62.5ns/clock which gives 375ns total.

I don't have access to direct lines. ;( NComm may transfer files
at 115200bps in theory - I have not tested it with two machines.

> Here in germany sysops like using connect to watch their atari
> bbs on the midi port, or their DOS bbs using connects doorway mode while
> beeing online in another box.

Ok, but needs for multiple connections in multiple windows are
very rare. Using multiple terminal-programs is (almost) the
same thing.

> You only need. OK that's fine to hea. But up to now, you seem to agree
> that the atari offers a better terminal emulator, right?

Comparing NComm to CoNnect - yes. But I need VT220-emulation only
when connecting to VAX-computers and I dislike the VMS, so I won't
do that very often..:)

> Oh ;-) Of course connect offers you various possibilities to work
> with all kinds of external protocols.

NComm also does, but I have need only for ZModem.

> Again ;-) good enough. Is NComm able to learn scripts?

You mean auto-scripts? - Answer is no. But, I have very good scripts
which came with Readmail (A mailer for NComm) and they work very
well when grabbing messages from varios BBS'es.

> Whats about direct lines, isdn or telebit worldblazer text downloads.
> You could be abe to use much more than 1710 cps.

Just now there are no direct lines available for me. All data
I'll download is already packed (if it's not, I'll do that).
When using baudrate of 38400 you should have no overflow
errors.

> Fine. You always forget direct lines and packable v42bis transfers. Even
> the latter allow you to get 5000cps with the online time saved for lharcing the

You may guess my aswer to this question..;)

> Text editors? Lots of powerful ones. What do you need?

Something like CygnusEd or Turbotext. A very good ASCII-editor.

> And C-Compilers? Lets take PureC (ANSI).
> Producing really good code (can sometimes even compete to gccs results but
> has very fast turn-around times). Includes very powerful source-level

I have SAS-C 6.3 (a commercial product) and an unregisted DICE-C.
They are very good products. Althought DICE is not a commercial
product (it's shareware) it'll do thighter and faster code than
SAS.

Tell me, Is the data path from the 030 to the rest of the computer 16 or 32
bit?

Tell me, Can you upgrade to a 50mhz 030?

Tell me, what would be the use of making 65536 color games? First, your
hampered 030 would have trouble runnuing these games. second, graphics would
require lots o Hd/disk space. Multiple 256 color pallet games are much more
reasonable.

true, but it is comming out. When? God only knows.

Got me there.

SCSI-II is out for the 4000 and will be for the 1200. (if it isn't already..)

Not sure what lan is.

Get with the program. Falcon has advantages, so does the 1200. I must ask why, so I will. Why an 030 with only a 16 bit data bus? Good gruef that was stupid..

In my humble judgment, VLT is the best VT100/Tektronix emulator for the Amiga (indeed, it was designed specificially for that by Willy Langeveld of the Stanford Linear Accelerator Center).

Among general terminal programs, I like Term. It has a VT100 mode, but I do not believe it is full featured (read: won't please those who know the difference between 'real' VT100 and it's demonic imitators). What it is is pure Amiga: indescribably flexible and powerful in terms of setup, options, protocols, etc. It uses the same XPR libraries as]

does VLT.

The 486sx is 32bit chip, without the floating point unit. Everything
else works. The 386sx uses a 16bit data bus.

No, they're not kicking themselves because the computer is useless,
it's that they may have to pay more if they need a math co-processor
to speed up some programs.

With a 68030 you will have to purchase a separate maths co-processor,
so you would all be in the same boat.

Does the Falcon use an EC version of the 68030?

Jim Fang

: a wonderful thing - much faster than using disks ;-)

Are you talking about null modem cables? I haven't heard of any modems capable of achieving 14000cps. Are you taking about bps?

: Whats about direct lines, isdn or telebit worldblazer text downloads.
: You could be abe to use much more than 1710 cps.

I haven't seen any significant differences between MS-DOS, Windows OS/2 or AmigaDOS cps rates when using z-modem. The cps rates are a function of the protocal and its overheads, the rate the system on the other end is sending stuff (related to cpu and storage medium) and the rate you can receive it (storage medium and cpu). The cpu does not play a significant part in the transfer times using z-modem. A 68000 can do just as well as a 486dx2/66 providing they are both storing the file to the same type of device, running at the same speed.

: Well, why not buy a 486 with OS/2? What makes a cool OS with fast response?

OS/2 does. It may be a pig, but it's a rather nice pig, and yes, more
than once I've considered switching. But until my Amiga becomes a dead
corpse, I won't be switching.

: Doesn't a NeXT do that, too? What about an SGI?

Definitely not an SGI; however, I've thought of NeXTStep, too. OS/2 and
NeXTStep are the only two other OSes I'd switch to, commercially speaking.

: There's a lot of machines that would fit that description, and the clones
: with OS/2 are even in most people's price ranges now.

And yet, AmigaDOS still has several advantages over them. But since this
isn't an OS/2 discussion...

: Well, I'm sure that you're saying this totally objectively. :)

Actually, yes.

Ouch! For $350 American dollars you can pick up a 300Mb IDE drives here in the Sacramento area. It probably a bit of a price war, though. Maxtor and Conner, I believe, were the ones being advertized. I threw out the magazine [California Computer News] in disgust after thinking about the $780 I spent for an 80Mb drive a few years ago. :) Oh, SCSI were $40 more, I think.

I think we can ignore the person who wrote the above tripe.

I have in front of me Amiga Format (where did I put Amiga Shopper?) and the price of the standard A1200 is about 360-380 UKL. The companies I have looked at are The First Computer Centre (leeds), Pheonix computer world and Gordon Harewoods computers.

From Atari St User I get 550UKL for the basic model (Gasteiner) and the same price from WeServe of Hampshire.

Was the person who wrote

>A 1MB (unusable) Falcon costs *NEARLY #300 quid DEARER!*

being deliberately dishonest? I think we should be told.

Xavier

-> Sure. Right. Add $20-$30.

-> Where does your clock plug in, by the way? (Don't waste your PCMCIA on a
-> clock... or even worse, your 32-bit slot on that!)

;-) Many point in many messages make me very smiling ...

... C= have included an internal slot for plugging the clock !

I have a clock from Microbotics that go in that slot.

$20-$30 more on a complete computer system, that's nothing.

I did not understand why all ATARI people talk again and again about
the clock. That's not a disavantage at all.

Some users that won't have it can not pay for it.

You must understand that C= won't make prices useless highly for
anybody that want an A1200, since that computer is intended essentially
for the home market.

So, here is two A1200 configuration intended by C= :

A1200 , with no HD and and no many things with, but VERY LOW priced,
for first-time users, or gamers. So if that users want to get a more
powerfull computer, they can add many things to it.

A1200/HD. Offered with a HD, users can add all things necessary to
make it complete with more memory, and a clock. C= DID NOT SELL
memory or clock. That explain WHY they're not selling a basic config
with all those things. C= have intended to give that market to
hardware developpers. So, vendors can offer you a config that fits
all your needs.

What is the problem here ?

You pay for what you want, and you get it !

I did not suffer that the basic A1200 that i have get have not a clock
built-in !!! I only tell to vendor to add one, after his suggestion,
and i've received a computer with a clock,(same as it is built-in) and that's all !!!!

Hey !!! is a PC user sad because he must choose a VGA card for his computer?
The vendor make a kit for him, and print a price sheet after, and
anybody is very pleased ... ! ;-)

-> >FIXABLE: Buy a SCSI subsystem for your 1200. > For how much? $100?

HEY !!!! I DON'T WANT A SCSI DRIVE !!!!

The mine (IDE) is VERY ADEQUATE ! ;-)

And i did not think that many A1200 users would want it.

Remember that A1200 is a home computer , and the priorities aren't same
that on other kind of market. The price is a good point in home computer
market, and A1200 got it. Falcon ????? ;-]

But, if i take the same kind of args for the market of A4000, i'm very
unpleased to see that C= haven't included a scsi controller, but i
did not find that dramatical.

Another point :

In what direc-to-disk recording is usefull for a 'homer' computer user?

It seems that's the *ONLY* point that seems to justify using of scsi
by ATARI FALCON users/advocacers !!

Ok, you can get scanners for scsi, and other things ... but we
will be able to get them via pcmcia in a near time, probably at a
much lower price, since PCMCIA is supported on compatible platform.

Bye!

To be honest, I don't recall seeing any CSA adverts recently. However,
mail-order ads do have them. Look in AmigaWorld, July 1993:

Memory World:
CSA 12 Guage A1200 68030
50 mhz Accelerator
with SCSI and optional networking controller
$639.00 with 4 meg add $159
with 882 add $135

>

Creative Computers:
GVP 1200 SCSI/RAM/FPU Board
0 meg RAM/no FPU $299
4 meg RAM/33mhz FPU $499

> Hmmm, maybe next time:)

Ok, you got me on the Microbotics. Their product id's are so similar to
GVP, that I got them confused and thought Microbotics had a SCSI too. As
hard as they work, though, I'd expect to see one soon.

Well, wasn't you intention in your first mail, that Amiga software is better than Atari's?
I don't wanna post all the Text-Editors or C compilers again... There are approximatly 20 good editors for the Atari platform, 80 % of them Shareware. Every time i show them to my friend, which ownes an Amiga, he is very impressed (and then he bought an Atari just because of Tempus Word...).

There are three well known C compilers. They were good enough to knock out all other competitors. GEM bases on C and programming in C is a pleasure on the Falcon.

I know, that most of the software is not available in the USA, but this will hopefully change...

Ciao, Heiko.

Same with the Falcon :)
There are absolutely NO informations about the size of the adress bus. The well
known german magazine c't writes: ...we have thought that RAM access is in
16 bit but benchmarks showed that it is in fact with 32 bit...
(It's obvious that DMA, Blitter and Video access is with 16 bit, there is also
the processor slot with only 16 bit - BUT: no informations about RAM access.
I want to hear where all you Amiga freaks get those informations!)

Second: Burst Mode is possible, even with 8 bit RAM! Please read the Technical
Data from Motorola! Only synchronus Access needs a 32bit adress bus.

Ciao, Heiko

It has a space for one, but not a socket. To put one directly on the
motherboard, it has to be soldered. Dealers can do this easily, with
another option being that pretty much every expansion card has one.

The slower speed is due to the CPU and custom chips having to use the same memory. By adding FAST RAM, the CPU has it's on little personal playground and can run full speed. You add soooo much to the 1200 because it's a low-end, affordable machine, and because you can. BTW, doesn't the standard Falcon come with only 1 meg of RAM itself?

>
> Is the 16 bit access in the Falcon really so terrible for a home computer?

YES! I *hate* it when my 030-equipped Amiga 500 has to dip into my 16 bit RAM.

> Will it really make such a big difference if some operation takes 30 secs
> instead of 15 secs to complete? Is the average user really gonna suffer
> by the 'yet unproven' affects of this 16 bit access?

Oh, it's proven alright. It makes a really big difference, when, say, you're rendering frames of a 3d animation, and you have a deadline to meet. Do you _really_ want each frame to take twice as long? I think not, especially when some more sophisticated frames take several minutes, or even hours.

>
> How many 386 and 486 _SX_ type systems have been sold with similar crippled

> is useless.

We don't say the _computer_ is useless. We say having a 32 bit CPU running with 16 bit access is a terrible design. We Amiga guys know- a lot of us have accelerators in our older, 16 bit accessing Amigas. It can be *very* frustrating when the 32 bit RAM runs out and 16 bit RAM is used.

Well my first attempt to this discussion is that ... I have never seen
the real falcon. I have never met anybody peronaly that has seen one. No adds.
So I guess tha falcon does not exist in Australia. Even if it does, that fact
that I would be a possible market and don't know it goes to show that they are
quite a flopp. C= can't fill demand here. Is that the word for Amiga in Europe
Not as well in the US But then again Atari has shut down in the US anyway ...
is that sort of a hint? I think atari is realy ownly woing well in the coin-op bussiness.
They are still trying to pass Atari ST machines in some stores.

No I'm talking about null modem cables and telebit modems. And I'm talking
about Cps. I want to see that Amiga Z-modem capable of 14000 cps.

>I haven't seen any significant differences between MS-DOS, Windows

>speed.

You seem to be an expert. But certainly not for zmodem-protocols.
The cpu plays the most significant part when you have a good hardware
to handle the incoming data stream. The most time is spent in updating
crc-values (of course using tables) and handling io to and from disk /
serial device. Talking of an 8MHz 68000 at 115200 bps
would have about 100 instructions to handle one incoming character. Any
486 at 66MHz will do better. (even if talking about the same speed the
68040 or the 486 can execute their instructions in less cycles than
an 68000 which will give you up to a factor of 4).

Well, Atari hasn't shut down in the USA, although at time we wish they could be sent packing to the Bahamas like C= 's management likes to do. :)

The Atari coin-op company is not the Atari computer maker. The down side of this is that Atari computer is also making videogame consoles (Jaguar) and the old days of knowing 100% that an Atari coin-op would be ported to the home system are dead.

(Interestingly enough, does anyone here remember when Nintendo made coin-ops? They haven't done one in YEARS... Sega is the only company still doing both... well, other than Neo-Geo :) )

Anyways, Falcon from what is *rumored*, is doing well. Reports here and there of US dealers selling out of them (even at the "high price" of the machine we've discussed).

I don't expect the Falcon to sell millions right off the bat, though. They don't have a large enough dealer base right now in the USA to pull that off. However, they do seem to be getting healthier (as a corporation) and it will be interesting to see if they continue to support the Falcon as they begin their first foray into videogame consoles in almost a decade.

P.S., Commodore, despite selling plenty of A1200s (relative to prior sales figures of other C= machines) has not really recovered yet from their $177 million loss... and I've seen postings about an attempt to remove the current management and try to rejuvenate the Amiga before the company dies... So neither company is terribly healthy.

>I want to hear where all you Amiga freaks get those informations!)

I'm not sure what machine you are referring to here, as it is not clear in your article. If you are referring to the A1200, the technical data for it is rather readily available to developers, and the data for it released to the public in general comes from that. I'm not sure about c't, but it would seem that a "well known" magazine would be a little better informed than what is portrayed above. If you are referring to the Falcon, yes, there is plenty of information about the internals of the machine available for development and the like, just as with the A1200.

>Second: Burst Mode is possible, even with 8 bit RAM! Please read the Technical
>Data from Motorola! Only synchronus Access needs a 32bit adress bus.

Not quite. In order to support BURST mode operations, the memory must operate (for the BURST mode transfer) in synchronous tranfer mode using *STERM. This removes the possibility of using anything other than a 32 bit port to memory, as this transfer mode requires it. Thus, BURST mode cache line filling requires a 32 bit port to memory be utilized. And in the above, I believe you meant "data" bus where you said address bus.

>REAL MARKS HERE.

I think it's dangerous to jump to conclusions about the impact of the Falcon030's 16-bit CPU to memory interface from your experience with the CSA mega-midget racer.

For example, Apple recently introduced new models of the LCII line which have a 32-bit interface to memory as opposed to the original 16-bit interface. I seem to remember that the speed increase was on the order of 15% to 30% (after taking into account the fact that the newer 32-bit LCII was driven at 24 Mhz as opposed to the 16 Mhz clock of the original 16-bit LCII).

The above is from my memory so I might have gotten some model numbers wrong.

The Falcon is much closer to the CSA example than it is to the Mac, for
one very, very good reason.

The LC II had 32-bit access to ROM, where the Mac Toolbox resides. A
great deal of a program's time is spent in this code, and therefore, less
of a hit is taken by a 16-bit bus.

The Falcon is much closer to the CSA/Amiga example in that very important
respect.

The Atari guys are not the only ones that keep it going, but we try to
do our part. It's funny that my 8 Mhz ST is quite acceptable for my
'average home user' type applications and I would imagine that even with
the as yet unclear effects of the memory setup on the F030 that machine
would be a significant improvement. I think we all agree that the A1200
(with FASTRAM ;) has a slight improvement over the F030 in the memory
system, but this does not make it an overall better computer (seesh, there
is no such thing as an overall better computer - there's always advantages
and disadvantages to any machine). Each machine has it's place and it
is really up to the user to decide which best fits his needs.

And I really don't think it is fair to compare the effects of dropping
your 030 A500 to 16-bit mode to the F030, since there are numerous other
things in the F030 that may affect overall system performance. Sorry,
I have no info to back this up, but there is more to the machine than
just 16-bit data access.

Yes it may not be a great as it could be, but hey it's not as great as
a Cray either. It's all relative and I would have to say that from the
limited info/experience I have, both the A1200 and F030 sound like
pretty decent machines. It really comes down to a matter of personal

choice.

Randy

Apple's LCIII is the new top of the line LC now. Has an 030 running at 25 MHZ
off a 32 bit data bus ot 16 bit...Street prices are low as $1100.00. However
this model is is supply constrained. Apparantly Apples manufacturing is
incapable of making more than 100,000 a month.

What do you mean.... An LCIII is cheaper than a Falcon and certain extent the
Amiga 1200.

There is no room for both machines on the market. Its either the A1200 or
the Falcon..... So far AGA Amiga machines have surpassed the 300,000 mark
versus 10,001 Falcons in user hands.....

Mike, you forgot to put "facts" in quotes. :-)

Mark, my local dealer went down to Atari on Friday to pick up 17 Falcons.
He sold 5 by noon, and on Saturday only had 6 left. He also said that
Atari has more people working on the docks shipping products than he's
ever seen. In the past, he'd only see 2 people, but on Friday, he saw
whole crews testing Falcons and loading hard drives with software.

Gosh, Atari is behind the times. In Apple's factories Macs test new Macs, not humans...

> just 16-bit data access.

Yes, but the thing is, the computer won't run without the CPU. It is the
single most important component in the computer. Once it is handicapped,
the computer as a whole will be crippled. Such problems at the very root
of the system should greatly affect it's potential overall performance.
And, I think it's very fair to compare my 030 to the Falcon's. It has a
very fast memory system (nearly twice as fast as the 4000's), plus I have
the OS ROM copied into the 32-bit memory. I'm sure the Falcon's ROM(s)
are in 32 bit memory as well-it's makes an incredible difference. So,
even when my computer has run out of 32 bit memory, it's still spending
most of it's time in the 32 bit OS code. Yet, the performance hit is still
very noticable and aggravating.
>

>
> Randy

I'll agree again. The Falcon sounds great, has a few good points and components, etc. But it is a matter of personal needs. Since I mostly do 3D rendering and graphics, I need computing speed and power. So, I'd definitely take an Amiga over the Falcon.

I was referring to the Falcon (oups, i have forgotten to mention...).
C't is correspondant to the american magazine 'Byte' (they are exchanging
articles). I must admit that the article was printed before the Falcon
appeared in the german shops, at this time informations were very limited.
I find it very astonishing, that this article is the only one with informations
about the Falcons RAM access.

(Second oups) Yes i meant data bus... sorry.
Hm. I have read it twice and there is no information like 'you need synchronus
access if you like to use Burst mode'. Well i have to check this out...

Ciao, Heiko.

:
: No I'm talking about null modem cables and telebit modems. And I'm talking
: about Cps. I want to see that Amiga Z-modem capable of 14000 cps.

I don't really see why it wouldn't. I have never heard of a modem
capable of obtaining 14,000 cps. That would mean you have your
serial port locked at 140,000 baud rate.

The Z-Modem is a proprietary protocal, not some arcane magic
that works on Falcons only. You can get the specs and source
code from a number of sources. Why would the Amiga version
be substantially different from the Falcon, or MS-DOS, or
Windows, or Unix, or... version?

Unless you think that there is something terribly wrong with the
rs-232 implementation supplied by Commodore. Or perhaps that
Motorola sell crippled CPU's to Commodore and souped-up ones
to Atari...

: >I haven't seen any significant differences between MS-DOS, Windows
: >OS/2 or AmigaDOS cps rates when using z-modem. The cps rates are a
: >function of the protocal and its overheads, the rate the system on
: >the other end is sending stuff (related to cpu and storage medium)
: >and the rate you can receive it (storage medium and cpu). The cpu

: >A 68000 can do just as well as a 486dx2/66 providing they are both
: >storing the file to the same type of device, running at the same
: >speed.

I should have added for "normal" modem speeds.

: You seem to be an expert. But certainly not for zmodem-protocols.
: The cpu plays the most significant part when you have a good hardware
: to handle the incoming data stream. The most time is spent in updating
: crc-values (of course using tables) and handling io to and from disk /
: serial device. Talking of an 8MHz 68000 at 115200 bps
: would have about 100 instructions to handle one incoming character. Any
: 486 at 66MHz will do better. (even if talking about the same speed the
: 68040 or the 486 can execute their instructions in less cycles than
: an 68000 which will give you up to a factor of 4).

I have not seen any problems with a 14.4k modem on a 8mhz A500 or an 486dx2/66 using z-modem. The cpu of both systems can handle this speed and obatain about 1680 cps. This speed is a limitation of the modem, not the cpu. But I agree, at 115200 bps, a 8mhz 68000 would not keep up.

But who gets 14,000 cps using a modem on their home computer? The fastest modems I have heard about are the ones at the Telecom (Australian Telecommunications Company) has 38400 bps, capable of getting 3840x4 througput (using on-the-fly data compression) using v42bis or mnp7.

I think most people would have 14.4k modems, with some having the faster zyxel 16.8k or 19.2k modems (including Sportsters, US Robotics, etc). How much would the 140k modem cost?

: Wolfgang

Yep, there is me. :)

Please remember I did state (and for kicks, I'll say it again) "I may still wind up buying an A1200". Yes, this is after flaming the machine. All of my criticisms of the 1200 do not come solely as an advocate of another platform, but also as a potential buyer. I don't think any of the A1200 advocates in this discussion have seriously contemplated the Falcon (and hence, any of its merits) except as a box made by C='s competition, and as such, their loyalty to their native platform (and way of life, and amber waves of grain, for spacious... :) ) makes them dislike the Falcon.

So, please remember, I'm looking seriously at both the A1200, the Falcon, and also the PC clone world. In a few months, I hope to have picked 1 or 2 of these platforms to purchase.... and (surprise!) right now if I had to choose, I'd *prefer* to get a 486DX clone machine over either because of the speed and potential market for any software I developed (and the fact that for my current needs, I can do MIDI fine on my existing machine, a Mega 4).

*sigh*

But I do want direct-to-disk recording eventually... :)

>

10,001? :) What an odd number! A palindrome! :)

I have to take issue with the statement that only one will survive. Both machines will have devoted followings, and the survival of the platform will partially be determined by who is using it. Like I said waaaaaaaaaay back in time, the machins were designed for different markets... so I'm sure each of these different markets can sustain enough interest in the machines to keep Atari and C= in existence, but not to the point where they prosper.

I think the MIDI market for the Falcon is THE selling point for them. The 1200 would probably be too "homey" for video pros who would want the A4000. But the niche is there, so it can sustain the machine.

Of course, no law says that either machine will be viable... it's not like one XOR the other, it may very while wind up being that neither one will succeed.

(notice that both companies are not hedging their bets, and are putting out game consoles?)

:)

As usual, you argue that money can fix the problem of the A1200 poor I/O
options. Of course you are right but money can fix any problem. Why
not keep to your word and compare the A1200 directly to the F' 030.

Pathetic?

Money can fix many problems, but not all. Unless you're talking about
a motherboard upgrade (which neither atari nor c= offers), you
can't buy your way out of basic architecture problems.

Like a 16 bit data bus. (you had to know it was coming)
```

I'll borrow a term from Ian :-)

HOLY FLAMING COW! Don't you Atari people get it? The A1200 is about
half the price or even less of the Falcon.

Remember: $199 gets you an internal clock + 2 megs fast ram + 25 Mhz 68881 FPU

This is still FAR LESS than a Falcon!

If you guys don't care about the fact that the Falcon is more than
double the price of an A1200, then let's compare the Falcon against
an A4000 with a '040... The Falcon will lose big time.

|>
|> Is the 16 bit access in the Falcon really so terrible for a home computer?

Yes, considering that you have to pay over US $1,000.

This price is NOT EVEN in a 'home computer area'.

|> Will it really make such a big difference if some operation takes 30 secs
|> instead of 15 secs to complete?

Yes.

|> Is the average user really gonna suffer
|> by the 'yet unproven' affects of this 16 bit access?

^^^^^^^^^^^^^
/

YET UNPROVEN? GUYS, GET IT! I had a megamidget racer (68030 @ 38Mhz)
on my old A500, and disabling the 32-bit memory (using only 16-bit memory)
crippled the 68030 to a crawl. IT IS WELL PROVEN, STOP SAYING IT's NOT!

|>
|> How many 386 and 486 _SX_ type systems have been sold with similar crippled
|> .... I mean computationally challanged ... architectures? I suppose all

|> is useless.

Well, ask anybody running a 386SX Windows and see if they like it.

Also, the 486SX *DOES NOT HAVE A CRIPPLED DATA BUS* The difference
is that it lacks an internal FPU, and for MOST APPLICATIONS, YOU DON'T
NEED THE FPU.

|>
|> Oh well, flame on...

Of course...

|> (*BEST* case possible...)

Someone told me about the 7mhz and I am the one who mentioned it now.
My understanding is:

CPU access to chip ram goes @ 7Mhz and when you add fast ram, CPU
access goes to the FULL 7Mhz.

: Can it really? There's a lot of catching up to do, and I'm sure you're not
: getting *everything* the Falcon offers for just $400 more.

: I am familiar with the CSA board that has been mentioned, but there is still:

: no DSP
: no LAN capability
: no 16-bit audio

While I agree with you on the DSP and audio ends, I really think that the LAN capability that you mentioned has no real place in any discussion of LCD machines. I can't see anyone buying a machine in the 1200's price range with the intention of networking the machine. Sure, it'd be nice to hook it up to the 500, or the 2000, or the ST that was going to go into the closet, but (at least on the amiga end) you'd have to go and buy a card just to get it going on both ends.

The target A1200 buyer has no need of networking - therefore, don't include it. The Falcon, however, is in a slightly different situation, at least for now. It is (right now) both the high and the low end machine in the Falcon line. Perhaps you could argue that every high end machine should come complete with the extra hardware built it. Here, I'd disagree. Most 486 owning home users don't need networking. If they do, then the hardware option is there for them. But rarely is an ethernet interface "on the motherboard" of any PC clone. It simply wouldn't be worth the cost of giving it to everyone, whether or not they need it.

I would like to see networking ability in the OS of any major machine, though. Hopefully 3.1 will be released with it as predicted.

Ha ha ha!
I saw this and I started busting up...
Dunno why...just sounded very funny to me! 8-)

As far as this whole 1200 vs. Flogger...er...Flagon....er...Falcon
debate, I really think it is a joke.

The Falcon has some interesting and possibly useful features, but, to use
a cliche (why not!) comparing the a1200 and Falcon is like comparing
apples and oranges.

The 1200 is meant to be a solid, somewhat expandable system, at a low cost.
In this it succeeeds admirably.

The Falcon is a hodge-podge of features, apparently meant to DO-IT-ALL (tm)
Unfortuntely it seems to be overpriced, under available, and poorly designed.

I'll stick to my old thrashed a2000... $-)

# 977. More Jaguar info from MDRAEGER@SCU.EDU

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-07 00:09:55 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Jul07.000955.151612@zeus.calpoly.edu>
Source record: 22312

More Jaguar info (from Data Quest this monday)

ATARI HAS CONTRACTED IBM FOR MANUFACTURING
Atari has announced that they have selected IBM for manufacturing of their new 64-bit multimedia entertainment system dubbed Jaguar. The contract valued at $500 million is IBM's first entry into the mass consumer electronics market. The Jaguar is an interactive multimedia entertainment system featuring over 16 million colors in 24-bit color graphics with 3-D polygons for creation of "real world" in real time. The system comes with a 32-bit expansion port for connection into cable and telephone networks, a digital processing port for modem usage and connection to digital audio peripherals. The system also comes with a double-speed compact disc peripheral. Assembly of the Jaguar system will take place in IBM's 2.3 million square foot facility in Charlotte, North Carolina facility.

HMMM.... Pretty big contract for Atari. But this might help explain why their stock has gone up over %100 just this week (last week really).

It ended about 4.5. (Good news for me since I have a few shares....)

- mike

(more info soon!)

This is *obviously* the Atari group as there are all kinds of posts
here by Amigans saying ATARI SUCKS, ATARI IS DEAD, etc.
Likewise amiga.advocacy s obvioussl the Amiga group as there are all
kinds of posts there saying AMIGA SUCKS, CBM IS DEAD, etc.
The only real difference is that the Amiga group attracts more MS-DOS
and Mac fans. Oh, also the Amiga group gets a lot more traffic. Thus
proving it is the cooler more popular machine and therefore showing that
ATARI SUCKS :-).

|> '>As for OS/2... I wonder if its popularity will be damaged by NeXTstep.
|> '>Francis
|>
|> Could be, but the hardware requirements for it are pretty steep. I
|> read somewhere that it needs a bare minimum of 16meg of ram and 120meg of
|> HD space. Although, OS2's requirements are pretty steep to a lot of people

NS/FIP's requirements are pretty steep indeed. I believe you can do greyscale with 8 megs of RAM though. Also, NeXTstep's apps appear to be priced fairly higher than Windows/DOS (and I'll assume OS/2) apps. This is saddening, considering how much easier application development is supposed to be with NS.

Oh yeah, one big thing is that NS/FIP is rather picky about the hardware. Only certain graphics cards will work well, and you need a 486DX (or Pentium ;). I think NeXT is really going after the higher education market (as opposed to the average home user) along with businesses, and it's most likely those people who are willing to shell out the money needed to buy a machine that can run NeXTstep.

|> also, at least their not that bad.
|> Besides, is NeXTstep capable of running DOS and Windows software as well
|> as OS2? I really don't know that much about it, thats why I'm asking. Does

NeXTstep 3.1 comes with a demo version of SoftPCb I believe. SoftPCb is developed by the same company that's doing the Windows/DOS emulation for WindowsNT. NeXT people claim, therefore, that the future of Windows/DOS emulation for NeXTstep is assured and that the emulation will be as good as Window NT's. The future of OS/2's Windows compatibility is questionable though right? I think 3.2 will actually include a full version of SoftPCb. And the upgrade from 3.1 to 3.2 will be free (except for people who purchased the evaluation version of 3.1).

Oh yeah, NS is only distributed on CD so that's another thing you'd need to get, rent, or borrow.

|> it have something like OS2's boot manager, so if it doesn't run DOS or
|> Windows you can at least boot up a DOS partition?

I don't know about this. I do know that the package box claims that you can have partitions for Windows, DOS, OS/2 along with NS (to allow you to be able to run those also I assume?)

I don't doubt that NS/FIP has the capability to make a large impact (even posing a challenge to Windows NT). It's user interface and the ease of

developing applications for it are arguably the best. HP and NeXT have formed a mini-company to port NS to their PA-RISC machines. HP's PCs can already run NS/FIP, and they expect the workstations to be running it early next year.

Thank goodness C= isn't the one marketing it eh? ;) (Though some people wouldn't be surprised if Jobs screws up.)

|> Greg Greene
|> ggg@kepler.unh.edu

Francis

P.S. I am extremely tempted to get NS 3.1 for my dad's 66Mhz Gateway, since students get the full developer's version for ~$250 (the rest of the world gets to pay over $2k for it ;). Of course, I'd have to persuade my dad to get another 8 megs of RAM...

> Remember: $199 gets you an internal clock + 2 megs fast ram + 25 Mhz 68881 FPU

This is really a cool price...
But there a still things missing in the Amiga 1200...
No DSP (well, that will be expensiv...), no SCSI, no LAN , no HD-Drive, no MMU
and tell me about the Harddisk in your Amiga 1200...

> If you guys don't care about the fact that the Falcon is more than
>double the price of an A1200, then let's compare the Falcon against
>an A4000 with a '040... The Falcon will lose big time.

That's nice, because the Amiga 4000 also has a bundle of 'design flaws'.

>|> Is the 16 bit access in the Falcon really so terrible for a home computer?
>
> Yes, considering that you have to pay over US $1,000.
>
> This price is NOT EVEN in a 'home computer area'.

Amiga users should not argue with speed. Compared to other systems (you know
which i mean :), Commodore and Atari machines have only little speed...
The speed loss caused by the 16bit bus is minimal. Believe me. I have a
Falcon for 5 months and it is working fine and fast.

>|> Will it really make such a big difference if some operation takes 30 secs
>|> instead of 15 secs to complete?
>
> Yes.

Hm. The Amiga 1200 is NEVER duoble as fast as the Falcon 030. It's still not
clear which one is the faster machine.

>|> Is the average user really gonna suffer
>|> by the 'yet unproven' affects of this 16 bit access?
> ^^^^^^^^^^^^^
> /
>
> YET UNPROVEN? GUYS, GET IT! I had a megamidget racer (68030 @ 38Mhz)
>on my old A500, and disabling the 32-bit memory (using only 16-bit memory)
>crippled the 68030 to a crawl. IT IS WELL PROVEN, STOP SAYING IT's NOT!

I have already replied to your post. If you use the old 16bit memory in your Amiga 500 you will only have a 7.1 MHz bus. 38:7.1 = 5.35...
That means your 32bit memory is 5.35 times faster than the 16bit memory only because of the higher cycle rate. The bus in the Falcon has 16 MHz like the CPU and the whole board.
Second: There are a lot of other accesses on your 16bit RAM from the Blitter, DMA and Video. That slows the 16bit access down (a little bit).
So where is the proof?

> Well, ask anybody running a 386SX Windows and see if they like it.

I own a 386SX-33. And i DON'T like it.

> Also, the 486SX *DOES NOT HAVE A CRIPPLED DATA BUS* The difference
>is that it lacks an internal FPU, and for MOST APPLICATIONS, YOU DON'T
>NEED THE FPU.

But most of the 486 machines have only ISA-bus running at 8 MHz. That's crippled!

Ciao, Heiko.

After posting my atricles to comp....arcorn, I ended up here ! ;)
My statement:
1.) The F030 has the better hardware (030, SCSI-II,...) than the
1200
2.) I have an A4000/040, which is better tahn both ... (although more
expensive, so don't say : my crimson is better, but more expensive :))
3.) My computer has a HD-Drive with 1.76 Mb (*Hihihi*)
4.) *END OF STATEMENT*

Have you heard anything about Atari's Jaguar????
It will blow this 32bits thingy out of the water!
Go to comp.sys.atari and take a look at the Jaguar profile...

It is not a bad machine, if it is released along with a CD drive for
the AGA Amiga line at the same time. It is 32 bits which is quite acceptable
considering that the best now is 16. As for too expensive, it is a bit
pricey, but I assume you are comparing it to the Atari Jaguar with CD
(oh wait a second the Jag doesn't come with a CD drive of course that
will be high on the priority list at Atari). If Atari can advertise this
and make it known as much as Sega then they will have a contender. The
Lynx is the best hand-held system around. It is cheap and high quality,
it is a shame no one knows that. Also how easy is it to make the Falcon
use Jag stuff, and the other way around. My fault that is not possible.

Later,
Rob Morton

Yeah, but it's more like the Amiga under 2.x or 3.0 than the Mac,
IMHO. In fact, one could simulate the Workbench by dragging the
drives onto the desktop and then using them instead of the folders
that are normally used.

>I only use the Drives Folder when I want to mass-Unzip something.

Now THAT was a creative flame! :) small ugly frog... heheeheh

>As far as this whole 1200 vs. Flogger...er...Flagon....er...Falcon
>debate, I really think it is a joke.
>

I agree, but then, as a participant, I kinda enjoy the sick creativity required
in a good debate! :)

>The Falcon has some interesting and possibly useful features, but, to use
>a cliche (why not!) comparing the a1200 and Falcon is like comparing
>apples and oranges.
>

Or Apples and DOS clones.

>The 1200 is meant to be a solid, somewhat expandable system, at a low cost.
>In this it succeeeds admirably.
>

It succeeds, but I wouldn't say admirably. The comparable Macs out there
are much much more expandable by virtue of the larger number of hardware
goodie to add.

>The Falcon is a hodge-podge of features, apparently meant to DO-IT-ALL (tm)
>Unfortuntely it seems to be overpriced, under available, and poorly designed.
>

It may *seem* overpriced, under available, and poorly designed, but so far,
I see no evidence that it is any of the above.

(at least, not moreso than the A1200)

I think for what the user pays, and the market it is aimed at, it fits just
fine. Sure, any computer could benefit from a price cut, but.... it's got

a ton of features geared towards the musician and hobbyist.

>I'll stick to my old thrashed a2000... $-)
>

I remember when a guy from the original A1000 design team told the world that the A2000 was not an improvement on the A1000 and that it wasn't capable of anything the 1000 couldn't have done.

:)

|> No DSP (well, that will be expensiv...), no SCSI, no LAN , no HD-Drive, no MMU
|> and tell me about the Harddisk in your Amiga 1200...

Well, like I said, the above price is still way beyond the falcon's and you get an FPU.

If I add $500 to the original price (to have a $1,000 A1200) I get a 68030 @ 50Mhz with at least 2 megs of fast Ram... want to compete against that?

|>
|> > If you guys don't care about the fact that the Falcon is more than

|> which i mean :), Commodore and Atari machines have only little speed...
|> The speed loss caused by the 16bit bus is minimal. Believe me. I have a
|> Falcon for 5 months and it is working fine and fast.

Compared to an Atari ST, yes... compared to a non-crippled 68030 or '020 no.

|>
|> >|> Will it really make such a big difference if some operation takes 30 secs
|> >|> instead of 15 secs to complete?

```
|> >
|> > Yes.
|>
|> Hm. The Amiga 1200 is NEVER duoble as fast as the Falcon 030. It's still not
|> clear which one is the faster machine.

No, but I am not the one who (1) implied that or (2) who said that. Still is
much faster than the %15.

|>
|> >|> Is the average user really gonna suffer
|> >|> by the 'yet unproven' affects of this 16 bit access?
|> > ^^^^^^^^^^^^^
|> > /

|>
|> I have already replied to your post. If you use the old 16bit memory in your
|> Amiga 500 you will only have a 7.1 MHz bus. 38:7.1 = 5.35...
|> That means your 32bit memory is 5.35 times faster than the 16bit memory only
|> because of the higher cycle rate. The bus in the Falcon has 16 MHz like the
|> CPU and the whole board.
|> Second: There are a lot of other accesses on your 16bit RAM from the Blitter,
|> DMA and Video. That slows the 16bit access down (a little bit).
|> So where is the proof?

My proof? HERE: I had a GVP hardisk that had Fast RAM (80 ns) for my
A500 that is in no problem with the Video and DMA stuff. It still slowed
down the '030 to a crawl.

|>
|> > Well, ask anybody running a 386SX Windows and see if they like it.
|>
|> I own a 386SX-33. And i DON'T like it.

Thanks for proving my point. This is what I said.

Hmm, I thought a 66MHz 486 should be faster at opening windows, too. :-)
I was disappointed with the one at work. Are you using localbus video,
also?

Well, how much is the Falcon? Last I heard, the atari nuts were claiming
"all this for only $700". (This was a while ago, I guess the price went up
alot.)

It's very fast, especially if you turn off the sound effects and the
silly "zoom" effects. Of course, being a silly person who likes to
hear windows open and close and see them zoom open, I leave mine
turned on. :-)

>I was disappointed with the one at work. Are you using localbus video,
>also?

Yes, and coprocessed localbus video at that. The board cost a bit
more than the run-of-the-mill SVGA, but the speed makes it worth it,
IMHO.

Ahh, that's the problem. I didn't know that zoom effect could be turned off. I've only played with OS/2 2.1 for about 10 minutes. Do you notice that lots of programs give application errors when quitting? The memory protection works great, though--freeing the offenders resources.

Hmm, I think we have some ATI localbus card. I'll have to check. My office mate has a graphics accelerator in his Quadra, too. His machine only displays 16-bit graphics. My Quadra has 24-bit graphics with a 20" monitor. It is hard to say which I prefer. If I could have the speed and the size, 16-bit graphics would be plenty.

## 996. False rumor article

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-08 03:50:41 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <21g5ih$ro5@usenet.INS.CWRU.Edu>
Source record: 22331
Cross-posted to: alt.games.lynx,comp.sys.atari.st,comp.sys.atari.advocacy

I wrote this several weeks ago for Z*Net, but it is now defunct and I don't think we will see it in AEO, so here it is...

The article was mainly to clear up some rumors.

False Rumors & News Tidbits
By Len Stys

If there is one thing that really hurts Atari Corporation, it is false rumors. These false rumors really can slow sales, drop the value of stock, discourage investment, and give everyone headaches. I have been hearing a lot of rumors as of late about Atari and I decided that it would be best just to go to someone who knows. I asked Bob Brodie (Director of Communications), Atari U.S. to either confirm or deny these rumors and that is exactly what he did. So let's crush some rumors before they really get out of hand...

The first rumor is about the Jaguar having NO memory. According to Bob, this rumor is absolutely untrue. The rumor was that in order to keep the price of the 64-bit video game console under $200, Atari had to take drastic steps and took out the memory. The memory was supposely going to be stored in cartridges and Atari would just charge more for games. But, the truth is that the cartridges will be priced similar to Super NES and Genesis cartridges. So if you were thinking that because the Jaguar is a 64-bit video game system, the cartridges would cost as much as NEO*Geo cartridges, you were mistaken.

Atari representatives have been saying that the Jaguar will be made in America. Is this true? Yes, Bob says that the Jaguar 64-bit video game console will actually be made in America. But he refused to say exactly where in the U.S. it would be made.

There was a rumor that the reason the Lynx cannot be found in many retail sotres is because Atari is requiring retailers to pay cash in advance. The retailers were not very happy with this and decided to stop carrying the Lynx and game cards. This is another untrue rumor. Atari only requires Atari computer dealers that have poor credit, no credit, or a history of late payments to pay in advance. This is absolutely untrue for Lynx dealers.

A rumor started by salespeople is that the Lynx is being discontinued. This is a false rumor as well. Bob said that Atari would not go through all of the trouble of a 800 line, 900 line, and an 8 page full color insert in national gaming publications if they planned to give up on the Lynx. Also, if you thought that this rumor might be true because you

haven't seen any new games for the Lynx, you'll be glad to hear that a few are on the way. Jimmy Connors Tennis, Gordo 106, and Lemmings are now being manufactured.

In an online conference a couple of months ago, Bob Brodie said that Garry Tramiel took a trip to bring back on board a number of dealers. Was he successful? Yes. We will see a number of Lynx dealers returning--especially a number of Electronic Boutique stores. Also, Garry Tramiel recently met with another firm, but since it was so recent, Bob did not know the outcome of the meeting.

There are a number of companies working on producing games for the Jaguar and the Lynx. This is another reason why you have not seen many new Lynx games lately. Everyone sees Jaguar games as their priority since the tabletop console market is much larger than the portable video game system market.

The Jaguar will be released this Fall in New York only. The Jaguar will have just under ten games when released (but this number may change as more games are being completed). Bob did not say this, but it is clear that Atari wants to make sure that there are a large number of games ready for when the company goes national with the Jaguar. I really doubt that New York is a "test market" since do you think a 64-bit video game system with 24-bit color and a DSP chip for under $200 needs to be tested? Nah...

Finally, it is unlikely that you will be able to expand your Falcon030 to have the Jaguar's 24-bit color and RISC chip. But, do not be surprised to see them used in future Atari products...

Well, see it from Atari's side:
Their Falcons are all sold out. Demand is much bigger than supply. Ataris main problem is the availabilty of the Falcon.
So tell me, why should they go down with the price?
Wouldn't this be economic nonsense?

Ciao, Heiko.

Well, it may be a good price to you... but for a games machines, I think about $250 is the price point people are willing to pay.

Incidentally, I just heard that 3DO will be selling their games for between $19.95-$39.95 and will come with two controllers. But $700 is still too steep for someone interested in just games.

Anyways, what type of games will be out for the C= machine? Atari's big problem with the Jaguar (at least, until they can prove otherwise) is that I don't see them getting a major arcade hit to convert for it.

Also, for $400, a person can get a Sega Genesis w/ CD-ROM, right? It may not be better, but it is better supported.

Well, here's the catch...the MSRP for Falcons was something like this:

$799 Falcon 1/0
$1299 Falcon 4/80
$1899 Falcon 14/80 (maybe a bigger drive, not sure)

I may be wrong as I'm doing this from memory, and there were various other possible configurations, usuch as a 1/80, etc...

The thing is, no Falcon I've heard of being released here in the USA has less than 4MB.... and none have come without the HD as far as I know.

They are usign a 68040 in a game machine?

For $400?

Won't this kinda hurt A1200 sales as it is "only" a 68020 and one of the
markets the A1200 is aimed at is the gamers?

Read again what he said. He said "with AAA and 040 released next year".
The current CD32 has neither a 040 nor AAA. But by the time the Jaguar
is released, Commodore might have a version that has both. Who can
say what the future will bring?

Freddy

>This time indicates 11.5 cycles/long word.
>(My ST runs the same program in 29 seconds, 9.3 cycles/long word.)
>

Well, not really. You have it do 50M nops. At 16Mhz for the falcon, and
18 seconds, that means ~5.75 cycles per nop. But I seem to remember the
030 loads up a long word for instruction fetch no matter what. So it's
5.75 cycles/long word.

The ST, on the other hand has a 68000, so it loads up a word at a time.
it runs at 8Mhz, and takes 29 seconds. So we get 4.64 cycles/WORD. Since
it's not twice as bad for a longword, we could get away with
8-8.5 cycles/longword.

Patrick.

Toys R Us, one of the largest game retailers, stopped ordeing LYNXs because they were not selling. You are right about the above. Sam Tramiel said that when the Jaguar comes out, they will try to pull the LYNX along with it - but he also noted that the profit margin on portable game systems is almost nothing while desktops carry a fairly large profit margin.

>The Jaguar will be released this Fall in New York only. The Jaguar will

San Francisco as well.

So far, the only errors that I've seen have been due to the Windows crap that I've run, and certain DOS programs. I have managed to cause errors and near lockups when playing around with the sound, video, and network drivers, especially in a DOS box, but nothing has been fatal. Personally, I'm trying to rid myself of anything and everything related to MSDOS and Windows, as I feel that they have nothing which I want or need, and lots of things which I would rather avoid. I don't even have a silly FAT partition on my machine, and I'm tempted to delete all of the Windows crap that came with OS/2.

I've got the ATI Graphics Ultra Pro VLB 2M and it's very nice, but so far the drivers only support the 256 color modes under DOS. The 64k and 24bit drivers are supposed to be available RSN, but I'm not going to hold my breath waiting for them. Under Winslows, I was using the

16bit 1024x768 mode and found it offered the best combination of speed and quality, so I'll more than likely use it in the future. OS/2 is faster than Winslows with regard to graphics operations, and I would imagine that it will do well in the hi-color modes as well.

Wasn't Motorola going to manufacture the very controversial 64-bit RISC
processor? I thought that IBM was doing the assembly.

You have absolutely nothing to compare it to. How do you know it's fast?
When I was a kid, TRS-80's seemed fast, but then I had nothing else to
look at. When (if) Atari releases an all-32 bit Falcon, benchmark the two
side by side, then tell me how fast it is.

> I have already replied to your post. If you use the old 16bit memory in your

Price cut, true, but with the low number of machines sold, can Atari afford
a cut? Doesn't look like it yet. A1200's have already dropped $100-$150,
after just a few months. Typical of C= machines, actually.

: options. Of course you are right but money can fix any problem. Why
: not keep to your word and compare the A1200 directly to the F' 030.

As a sidenote, if money could fix the problems of the Falcon, I'd consider it. But no amount of money short of hiring someone to redesign your motherboard for you will fix the problems created by the architecture of the Falcon itself. The Falcon will always be akin to an old, 68000 architected system with a 68030 thrown in, like the old A2000/500 systmes were when you tossed in an 030 board.

: That is the reason for my hesitation

The question is, will Atari's Falcon survive, or will it be held aloft by the sales of a Jaguar? Will Atari fall back to games systems simply because they cannot compete at their current level, and carry the Falcon along until they are a more capable company? Or will the Falcon disappear?

Greg

Greg,

How do you know that the Falcon030 doesn't also have 32-bit access to ROM? If you don't know for sure, then how can you criticize the Falcon030 in this regard? Weren't you the same person who criticized the ST BLiTTER for being non-DMA and only able to do simple block moves? Since you were wrong then, it's possible you're wrong now.

Having said this, I also want to make a comment about this 32-bit ROM thing. I think it's performance advantage might be a little exaggerated. Most ROMs have access times that are much longer than the access times for RAM chips. For example, there are a lot of PC clones that copy the ROM BIOS routines into RAM to get a performance boost. I would think that the slower access times of ROM chips would negate the advantage offered by being 32-bits.

In my opinion, the Falcon030 is closer to the Mac LCII example than the CSA/Amiga example. Why? Because the Falcon030 was designed with the 030 in mind. Sure, the 030 has to go through a 16-bit bottleneck. But the system was designed to lesson this bottleneck as much as possible. Just like the original Mac LCII.

By contrast, the 030 in the CSA/Amiga has to talk to chip RAM through a design that was optimized for a 68000 -- not a 68030.

Well, the Jag is due in the Fall in N.Y., and released everywhere else in
early '94. Now, considering that Atari has shipped developer units of
their box, and are experiencing a surge in stock price, I think they
are considered (by those who are buying in) to be a viable contender
in the home console arena.

>after just a few months. Typical of C= machines, actually.
>

So C= routinely overcharges their initial customers? :) heheheheeh

Well, we'll see if they cut the price. Part of supply and demand is that
if the demand declines, the price will come down. This might just be
an indicator that the market Atari is aiming for is willing to buy all
of the currently manufactured units at a price dictated by Atari.

This is America... capitalism... money... want to make it? :)

Gerry,

I am inclined to use your own argument against you. Has the
Falcon '030 been designed with the '030 in mind ? I just don't see
that. If you have a 32 bit processor 'in mind', it would seem to
follow that you at least give it a 32 bit bus. If you know of some
optimizations which the designers provided (besides the '030's cache),
I'd like to know them. Until then, I am still kind of in the dark as
to why Atari, and Apple, for that matter, would do such a thing to a
system. (other than cheepness)

I'll be blunt, this is silly and stupid. There is a great deal of
difference between what resides in ROM on an Amiga, a Mac, and a Falcon.
The REASON a 16-bit Mac can spend most of its time in rom is because the
Toolbox resides there; and most of the time, user code is in the toolbox
on a Mac. The Amiga and Falcon exist at a much closer level.

: the access times for RAM chips. For example, there are a lot of PC

Yes, incredibly true. That, however, does not preclude the possibility
that ROM would be faster than 16-bit ram, does it not? See, that's what
is inevitably being discussed by that--two 16-bit fetches will be slower
than the 32-bit fetch to the rom, and therefore, less of a hit is taken
on Macs in the Toolbox.

: In my opinion, the Falcon030 is closer to the Mac LCII example than

Ya. An expansion slot designed using 68000 signals, 14-MB address space,
16-bit access to ram... Sounds like a 68030 to me. Not. Everything
about the CPU end of the Falcon design says they designed it to use a
68000, and later tossed in a 68030.

>disappear?

Greg, that's a pretty lame argument as you are advocating the A1200, which is being made by Commode...er...Commodore, a company that lost $177 million, has an extremely unpopular board of directors (at least among the users, possibly as bad as the view Atarians have of the Tramiels!), and is a public company (i.e., unlike Atari, a majority of the stock is not in the hands of a family or person).

On top of that, I could rephrase your argument against the A1200 as say... "Gee, well, is the CD32 Amiga game console going to carry them along until they become a more capable company?"

Let's face it.... Commodore has never before marketed a game machine. They have never made an arcade coin-op. The name Commodore is not even remotely associated with the videogame era, except perhaps as the company that made the computer (C64) that stole a lot of thunder from the game consoles of the early and mid-80's.

I think the Jaguar is a good move by Atari. Honestly, it won't help Falcon sales unless $$$ from the Jag profits finds its way into R&D or advertising for the Falcon. But your argument is simply ludicrous.

Ok, how much RAM does the A1200 go to, without going to 3rd party FastRAM?
The product literature says considerably less than the 128MB we both know
it can go to.

You're spreading lies and misinformation to claim the Falcon only hasa
14MB address space. The '030 is free to take advantage of as much TT-RAM
as is thrown at it.

Why did people buy NS on NeXT computers in the first place? Were they
'UNIX' boxes, then, or something? NS doesn't seem to have a 'purpose',
if you know what I mean.

: I thought that was IBM's RS/6000s?!

: Seriously, what makes it a great development system?

What makes NeXTStep great? Interface Builder is powerful and quick, generates great code. NeXTStep itself is fully object-oriented, and programming for it is both quick and a dream. And the OS is very, very capable. The development tools available (IB being a part of that) are unsurpassed.

: Why did people buy NS on NeXT computers in the first place? Were they
: 'UNIX' boxes, then, or something? NS doesn't seem to have a 'purpose',
: if you know what I mean.

NeXTStep is BSD and Mach, yes. But NeXTStep is also amazing for itself. With an awesome collection of very advanced applications for it, it had a lot of potential. I do believe that's where Lotus Improv had its roots, and Mathematica isn't shabby there either. In the end, it makes for a wicked workstation; but it didn't make for a fast one, due to their architecture designs. When all of the workstations were doing fast RISC, the NeXT was using an 030 and later an 040.

I still think the NeXT was one of the best looking computers in existence, I thought the cube was fantastic. The OS was great. Display Postscript was a good idea, even if it was intensive. The system oozed with power from everywhere but the hardware itself, and that's what hurt them.

In my opinion, of course. There's no bias, I don't own one, I don't work for them; I've merely used them at the University, where we have several cubes in a lab.

Its also the reason I think NT has no hope. I always believed that in the end, Unix would triumph over NT. NeXTStep shows just how far Unix can go beyond the csh prompt.

: hands of a family or person).

Yes, true. However, unlike Atari, Commodore doesn't have any plans on creating a separate line of systems to gain entry into the games market. Atari has a past of living off of games systems. Will they do it again? They could. At that point, the question becomes, what becomes of the Falcon?

: "Gee, well, is the CD32 Amiga game console going to carry them along until
: they become a more capable company?"

Commodore is proclaiming the CD32 as an Amiga. Will the Jaguar be a Falcon? CD32 will run the same OS as the rest of our Amiga systems, it will be integrated with the Amiga line. The Jaguar is a separate entity, a separate line. If the Jaguar does well, will they drop the Falcon for it? Who could say?

: Let's face it.... Commodore has never before marketed a game machine. They

Well, actually, that's all they've ever done. The problem was that they were doing it with a full-fledged computer system.

: associated with the videogame era, except perhaps as the company that made
: the computer (C64) that stole a lot of thunder from the game consoles of
: the early and mid-80's.

Well, Atari Games isn't exactly the same entity as Atari Corp., but granted. And they did do relatively well with the Lynx, which I still consider to be one of the best. Then again, one must also take into account that the Lynx was created by Epyx and bought by Atari. One can't really say that Atari has been successful with anything it has created of itself.

: I think the Jaguar is a good move by Atari. Honestly, it won't help
: Falcon sales unless $$$ from the Jag profits finds its way into R&D or
: advertising for the Falcon. But your argument is simply ludicrous.

Is it? If the Falcon swoops while the Jaguar soars, would they decide that they need to concentrate on the Jaguar and let the Falcon fall to

the wayside, or simply put it on hold? Would they take the chance of spreading their R&D away from the Jaguar when they so desperately need to take hold of the market, would they turn their money from the Jaguar into their other systems and risk that money on the swooning computer line rather than pouring that money back into what they're making the money in, the Jaguar, and its predecessors?

That's the question. CD32 is just another Amiga. The Jaguar represents a fork in the road for Atari, and the question becomes will they take the road led by the Jaguar, or will they follow both paths? Small companies often can't afford to follow both without compromising their efforts, and Atari can't afford to compromise their efforts; knowing this, the decision becomes less clear.

May I have a word in edgewise? You've fucked up again, thought I'd just
mention that the A1200 has nothing close to that address range.
Remember, it's an EC020, there are 24 address pins, not 32.

: You're spreading lies and misinformation to claim the Falcon only hasa
: 14MB address space. The '030 is free to take advantage of as much TT-RAM

The system is set up to take 14MB of ram, all ST ram. Adding it through
the slot may or may not work, which is why I didn't comment on it. It
would certainly work if you placed the CPU on that expansion bus, but
whether or not you could get 32-bit access to TT ram on that bus is very,
very questionable. That expansion setup is a straight 68000 set of
traces. Any CPU on the motherboard would only be able to access anything
in that expansion port in 16-bit increments. That doesn't even include
the fact that they've got a 16-bit bus to memory on that cpu, and the
fact that it's very likely that they've only put 16 bits of address as
well, to save board space (because it would be unneeded).

So, the real question becomes just how much did they cripple it? Do you
have 16-bits of address space, or did they divide it in half--16 for the
motherboard, and 16 for the expansion system. 'Fraid I can't answer
that. But I do fear that the answer will be the easiest one they could
give--16 bits of address. Actually, that would HAVE to be the way it
works; dumb, must be too late. You've got 16-bits to access the
motherboard with from the expansion bus, and it has to work in both
directions that way. Not the happiest answer, is it?

Moving the CPU to the expansion bus works just fine, yes, you get full
32-bit access and 32-bit address if they provide for it; but that doesn't
say anything about motherboard capabilities--the fact that the expander
is a set of 68000 lines says you've got limits on what you can do.

Any self respecting MIDI users out there to prove it?
Yeah, hard work to split the combined out/thru into separate jacks, even requires a cable and some soldering :-).

>And most of all Bars & Pipes Pro 2.0 leaves Cubase eating dust! (as

Wrong. The Falcon motherboard was especially new designed. This is just another
ugly rumor which is definetly not true.
I think you are referring to the 16bit data bus (it's still not clear that the
Falcon really has a 16bit bus - no one has answered my question about their
source for this information yet) than you will have to know:
It is fixable (when necessary), ask GES*ft about their 32bit FastRAM.

>The question is, will Atari's Falcon survive, or will it be held aloft by

Don't be so sure that the Amiga will live forever! You are speaking about
a serious problem here, which is not only one for Atari (Have you regarded
the games market the last two years? Have you noticed that things have
changed there, not only for Atari but also for Commodore? Do you know that
the games market is the most important section for the Amiga? Do you
know that Commodore can also not compete in the professional market, so their
games systems like the Amiga 500/600/1200 must held them aloft?)

Quite something to think about, isn't it?

Ciao, Heiko.

Shame on me, but this is the truth:
ROM access in the Falcon is really with 16-bit. This information comes from
Atari directly.
I'm more interested in how he knows that the Falcon has 16-bit access to RAM.
There is still no information about this. I think this is still a unproven
supposition (if not: give me mail).

Ciao, Heiko.

Well, odds are good that if the Tramiels are decisive (a facet of themselves
we've rarely seen, except during product announcements :) ), if the Falcon
does not sell, it'll either be supplanted by a new machine (Falcon040?) or
dropped. But considering how bad prior sales of Atari computers were
compared to the clones or Macs, I don't think the Falcon can do anything BUT
improve on this.

Well, if the Jaguar does great and the Falcon does about as good as the Mega
STe line, it's pretty clear that they won't drop it because regardless of
any other factors, it would be profitable.

<now, whether they would benefit from streamlining and becoming just a
videogame company is another thing... Atari has not shown any signs of
dropping the computer market at all...in fact, if they are smart, they'll
probably keep their hands in both as long as $$$ permits>

>

How much money would need to be spent on the Jaguar R&D when the machine is
done, finished, and shipping? That seems a little odd. You don't
engineer the machine over after it ships (although you've suggested they
do this to remove the 16 bit access to chip RAM in the Falcon :) ).

>That's the question. CD32 is just another Amiga. The Jaguar represents

>decision becomes less clear.
>

I don't that's a real problem. The Jaguar is aimed at one market, the Falcon at another. If one is more profitable, then they'll devote more resources to it, I'm sure.

In this day and age, I think we all agree the game console market is more open to new competition (who can break the hold of the Intel boxes? who'd want to see Atari and C= make Intel-based machines? And would that be "bad"?)

Naughty, naughty Greg! Let's be civil! These are only computers! Now go
say three "Hail Miners!" and beg the forgiveness of Irving Gould. :)

>mention that the A1200 has nothing close to that address range.
>Remember, it's an EC020, there are 24 address pins, not 32.
>

I did make one error... I forgot the built-in limitation of the A1200 to
16MB of RAM. Of course, that's a whopping 2MB more than the stock Falcon
specs call for (14MB) unless we add TT-RAM.

So, out the box, the Falcon can address more RAM. :)

Kidding aside, I slipped up... I was thinking of all the neato '020 and
'030 accelerator boards that can let the A1200 go beyond that 24-bit
addressing limit.

(please note that such a limit is not strictly enforced on either system
and 3rd party solutions already exist for both...)

>: You're spreading lies and misinformation to claim the Falcon only hasa

>fact that it's very likely that they've only put 16 bits of address as
>well, to save board space (because it would be unneeded).
>

Ummmmmmm..... now, this is where we go into dangerous territory, so let's ask the people who know. :)

First of all, you are ASS-uming :) that the 128MB 32mhz 030 expansion goes on the 16-bit (ugh!) slot which has 24-bit addressing in the Falcon. But it might be a soldering hack 'n slash upgrade. The company's name is GESoft and until we know for sure how it is added to the system, and what the limitations may or may not be, I henceforth throw that argument out of this courtroom until you can provide evidence to the contrary.

For now, let's go to the facts... the board goes in the Falcon, gives it up to 128MB of RAM, most or all of which is known to be TT (CPU-only) RAM. This increases performance as this RAM would be accessed 32-bits at a time... with no contention with the remainder of the Falcon's chipset.

>So, the real question becomes just how much did they cripple it? Do you
>have 16-bits of address space, or did they divide it in half--16 for the

>that. But I do fear that the answer will be the easiest one they could

Greg, you're grasping at straws, trying oh so hard to flame when you don't have facts. Please do more research. If this were a court of law, this evidence would be thrown out as mere speculation. And if you're speculating, and spreading it as if it were the gospel, you're misleading people.

Don't let personal bias for or against the platform make you look silly. :)

>Falcon really has a 16bit bus - no one has answered my question about their
>source for this information yet) than you will have to know:
>It is fixable (when necessary), ask GES*ft about their 32bit FastRAM.

In the old days, chips had 16 bit registers (like the 8080 in 1970s) and an 8 bit data bus. This was due to the "silicoln" real-estate and the number of pins. That meant to read a word, you had to take two bus cycles for reads . This continued. I.e. the 68000 is 32bit with 16 bit data bus (and 16 pins).

The 030 HAS 32 bits for the data bus. If Atari truely has a 16 bit bus on the Falcon, it is just because they were excesively cheap. (And it wouldnt even cost that much). I will assume that it really does have only a 16 bit bus, as everyone seems to say it does. It STILL has 32 pins. That means that the memory controller must have a 16 bit latch, and when a read is asserted, it reads and latches 16 bits, then reads the other 16 bits (and places them on the other 16 pins/bus) and THEN assert DTACK which tells the 030 that the data on the 32 lines is valid.

What does this mean? For one, the reading time is probably not doubled, although it is definately slower. An aside: I guess it is possible that Atari left 16 pins not connected and wrote its software to prohibit any 32 bit access. But that would be ludicrous and slow the machine by 6 to 8 times I would imagine. So I assume that they do it with a memory controller that latches 16 bits.

Anyhow, if you had VERY fast RAM (i.e. 10 to 20ns) there would be no slow down, as the controller could have all 32 bits valid is less time that the 030 could recognize the DTACk and other handshaking. But I am sure that it has 80ns RAM. (at best).

In any case, just some more info to mull about. The speed would not go to hell, although it would be slower.

(Oh yeah, anyone with some time on their hands could take out the existing memory and controller and redo it (with the memory map the Atari expects in mind) so that all 32 pins were directly hooked to memory. It would take some effort, but not cost very much.) (You would also have to be a very good wirer (wire - er : one who wires?)

If it truely has 16 bit ROM, I am sure the RAM is 16 bits. It wouldn't make much sence to have a 32 bit data bus hogging up space on the circuit board, and then only grab 16 lines for ROM. I am sure that it is either both 16 bit or both 32 bit. (more likely 16 from what Ive seen)

>

When you say 16-bit memory, what do you mean? Is this the Chip RAM on the A500's motherboard? If so, then this is precisely the reason why I feel that accelerators such as the megamidget racer is a poor example.

Sure the 68030 is crippled to a crawl. It not only has to go through a 16-bit bottleneck but it has to talk to memory that was designed for a 7.16 Mhz (or something like that) 68000 -- not a 38 Mhz 68030!

In other words, there are two bottlenecks. The speed of the memory chips _and_ the 16-bit data path. That's why you guys are experiencing 4 or 5 times the slowdown.

I'm claiming that the Falcon030 is more like the Mac LCII. In that situation, the original 16-bit Mac LCII only experienced a 15% to 30% slowdown from the newer 32-bit Mac LCIII.

I'm wondering wether the Falcon will support full 8 channel digital audio
IO with hard disc recording (like the session 8, soundscape, protools etc).
I know there exist D2D, but it is limited to 4 tracks.

Thanks and Cheers,
Henrik@robots.ox.ac.uk

No, it's not. Considering a Genesis + Sega CD is about that price ($400),
and the SEGA CD has sold a lot.

|>
|> Incidentally, I just heard that 3DO will be selling their games for between

|> I say. Even dopey CGA has been out for eons!

Er.. NS/FIP can do color if you have 16 megs of RAM. Though it does 16-bit color, no support for 24-bit yet I don't believe...

|> >Oh yeah, one big thing is that NS/FIP is rather picky about the hardware. Only

|>
|> I should say so. NS/486 seems more of a pricey toy than a 'computer' as
|> we know them.

I don't consider $250 for the full developer's version to be overpriced at all... of course, only students get to pay that little. :)

|>
|> >Oh yeah, NS is only distributed on CD so that's another thing you'd need
|> >to get, rent, or borrow.
|>
|> How big is NS, anyway?

I think on the order of 100 and 200 megs for the users and developer's version respectively.. keep in mind that this comes with applications like Emacs and the highly praised TeX package with graphical front end..,

|> >developing applications for it are arguably the best. HP and NeXT have formed

|> >NS/FIP, and they expect the workstations to be running it early next year.
|>
|> I thought that was IBM's RS/6000s?!

Hmm... I doubt this.. why would IBM want to promote an OS that is a threat to OS/2? :)

|>
|> Seriously, what makes it a great development system?

I don't know very much about NeXTSTEP myself. But many people (businesses using NeXTSTEP, etc.) claim application development time to be on the order of 3-10x what it would have taken them with any other OS.

If you are truly curious, ask the people on comp.sys.next.advocacy.

|> Depends on how you measure success. If NeXT stays in business another year,
|> I'd call that success!

At first I thought their decision to go all out software was foolish, given that they'd be facing extremely tough competition from Microsoft and all the other UNIX variants out there. But now that I look back, I realize that the OS was what I liked the best about the NeXT systems.. sure the hardware was nice, but what really attracted me was that you get a concurrent multi-user OS with an awesome graphical interface on top. NT doesn't offer that, and neither does OS/2.

|> Why did people buy NS on NeXT computers in the first place? Were they
|> 'UNIX' boxes, then, or something? NS doesn't seem to have a 'purpose',
|> if you know what I mean.

I'm not quite sure what you are asking... all NeXT computers came with NeXTSTEP on it.. The purpose of NS (in my eyes anyways) is to offer the power of UNIX, but at the same time make it easy to use and program on.

The one big concern I personally have with NS is that the applications seem much more expensive. If applications are so much easier to develop, you'd think they would be priced a bit cheaper!

|> them.

Yeah, I agree completely (except for the part about the Cube.. I didn't think it was _that_ great, especially considering the cost...) Only now are we seeing hardware that can run NeXTstep reasonably fast for a somewhat reasonable price. I wouldn't mind an HP 9000/735 running NS myself. :)

|> Its also the reason I think NT has no hope. I always believed that in
|> the end, Unix would triumph over NT. NeXTStep shows just how far Unix
|> can go beyond the csh prompt.

I think NT does have hope. I don't feel it has a chance of overcoming Unix, the big thing being that NT doesn't allow multiple concurrent users at the moment. (Though the way NT was designed, supposedly multiple concurrent users is completely unecessary.) However, with faster hardware getting cheaper quickly I don't think it will be TOO long before a fast NT system will be affordable. And combine that with Microsoft marketing... NT has a good shot at dominating the PC world.. but I too believe that Unix's future is not threatened by NT.

Yes but you fail to realise that Jaguar is not being done by Atari the
Coin-op company. But by Tramiels band of jolly nosedivers. There is no
indication of ports from Atari Games. In face Electronic Engineering
Times said it would be highly unlikely. IMHO Jag/3DO/CD32 all have a high
likelyhood of flopping in the US market, all for different reasons.

Get out your calculator. Do to being an mbeded Controller the address is
24bit.

Ok I'll save you some time. Sixteen Million Seven Hundred and Seventy
Seven Thousand Two Hundred and Sixteen bits.

A little over Two Million is given to Chip Ram
A little over Four Million is given to PC0: [PCMCIA version 2 slot] OR
FastRam
A little over Four Million is given for Fast Ram (over 8 if you eat the
PCMCIA ram allocation space, which you should do since PCMCIA ram cards
are 16 bit and not worth the money IMHO)

The remainder are address space for OS Routines/OrGodKnowsWhat.

At least they don't waste space on ROMS like Apple did with Quadra. Geez
3 whole GIF pictures of the design team.

Of course To add 8 megs of Fast Ram is a simple deal. If you can open a
NO SCREW plastic cover and slide in the card then hey!

Add $350+ depending on speed/ram/configuration for an 030 card and you
have the full 32bit address range of appx 3-4Gigs. Wouldn't want to spell
it out like above! Of course those features include more expansion slots
on the accelerators for SCSI-II/Networking/YouNameIt. The SCSI-II option
of one of the cards uses the knockout on the back of the 1200 to put the
external SCSI connector.

: Greg, Greg :-(. This 'Amiga is a games machine' BS comes directly from YOU.
: Seems you should check the meaning of what you write sometimes.

: Gotcha!

Oh, boy. Okay, I'll try to _EXPLAIN_ jokes more often. Everyone, everyone, everyone has heard someone say to an Amiga user, when the computer is mentioned:

"The Oh-mee-ga? Isn't that a game machine?"

If I -EVER- say that it's because I expect it to immediately be seen as a joke. I get annoyed when someone says that to me, and so do others. So, we're left with a known Amiga lover making a satirical comment about his own computer.

Can ya handle that? If not, I'll stick a tree limb up my ass and try to be more politically correct.

Greg

(zcam1121@rpool9.rus.uni-stuttgart.de) wrote:
: In article <21hp6aINNm17@uwm.edu> gblock@csd4.csd.uwm.edu (Gregory R Block) writes:
: >As a sidenote, if money could fix the problems of the Falcon, I'd
: >consider it. But no amount of money short of hiring someone to redesign
: >your motherboard for you will fix the problems created by the
: >architecture of the Falcon itself. The Falcon will always be akin to an
: >old, 68000 architected system with a 68030 thrown in, like the old
: >A2000/500 systmes were when you tossed in an 030 board.

: Wrong. The Falcon motherboard was especially new designed. This is just
: ugly rumor which is definetly not true.

Nobody can say how or when the actual motherboard design was finished.
Nobody can say that they didn't originally intend a 68000 for it. But by
looking at the design itself, one sees remnants of a 68000 architecture,
not a 68030 one.

: I think you are referring to the 16bit data bus (it's still not clear that the
: Falcon really has a 16bit bus - no one has answered my question about their
: source for this information yet) than you will have to know:

I've gotten mine from the net, as well as who I believe was the only
Falcon dealer in Wisconsin, who has since gone out of business. Which is
okay, 'cause here in Chickenmilk, we don't need Falcons. We've all got
Cray Y-MP systems sitting around in our living rooms to use as really,
really tall coffeetables. And since none of us drink coffee, it doesn't
matter HOW tall they are.

: It is fixable (when necessary), ask GES*ft about their 32bit FastRAM.

FastRAM will not FIX the ST-ram. I do understand -WHY- they gave it a
16-bit bus, I just don't agree with it. ST compatibility isn't important
enough to make me want to cripple an otherwise pretty cool design.

Because of the ST-ram, you will always access the motherboard, whether
from the expansion slot (guaranteed, that thing walks and talks like a
68000 is on the other end) or from the CPU, in 16 bits. On the 030,
that's a real penalty.

On an 040, it'll kill you. On the 030, the 030 will do two reads to
16-bit ram automatically, a single 32-bit longword.

On an 040, that 040 will make _8_ of them right away, to fill a full
cache line. Even if you won't be needing it. On _TOP_ of that, your bus
logic is EXTERNAL--the 040 no longer supports anything but 32-bit buses,

the bus-sizing logic was removed. So you'd better have fast logic,
or you'll be taking an even GREATER hit.

: Don't be so sure that the Amiga will live forever! You are speaking about

Who said I was?

: Well, odds are good that if the Tramiels are decisive (a facet of themselves
: we've rarely seen, except during product announcements :) ), if the Falcon
: does not sell, it'll either be supplanted by a new machine (Falcon040?) or
: dropped. But considering how bad prior sales of Atari computers were
: compared to the clones or Macs, I don't think the Falcon can do anything BUT
: improve on this.

But that was when there was only the ST line... Add a whole new line,
and they may choose one road instead of travelling both.

: Well, if the Jaguar does great and the Falcon does about as good as the Mega
: STe line, it's pretty clear that they won't drop it because regardless of
: any other factors, it would be profitable.

Unless they can only afford to do one of them. Or, by consolidating,
they could push one system into the market with enough force to roll a
big profit.

: <now, whether they would benefit from streamlining and becoming just a
: videogame company is another thing... Atari has not shown any signs of
: dropping the computer market at all...in fact, if they are smart, they'll
: probably keep their hands in both as long as $$$ permits>

Well, I'm not talking about demographics NOW, I'm talking about
demographics after the Jaguar release. That's why it's a difficult
prediction.

: I'm not sure of that. With the C64, maybe. With the Amiga, I think they
: were trying to find the heir apparent to the throne of the C64 as the
: best selling PC out there...

: Did Commodore create the Amiga? :) I seem to remember a guy named Jay
: Miner... :)

Yeah, but that C64 was Commodore's fault. :) So C= has been successful
with a system of their own. Actually, when you think about it, not one
system made by the ol' Amiga crew has ever done well.

First, they make the Amiga. Then they run out of money, and C= buys it.
Relatively speaking, it flops.

Then, they make the handheld system, later to be dubbed Lynx. Epyx runs
out of money, Atari buys it.
Relatively speaking, it flops.

Now, they've got their hands in 3D0...

I wanna know if it flops. Somebody flip to the last 10 pages of the book
and read them...

: How much money would need to be spent on the Jaguar R&D when the machine is

Not R&D, son, MARKETING. Like it or not, the Jaguar has stiff
competition, and it isn't even in the form of hardware. Sega and
Nintendo will market Atari into the bit bucket, and Atari will have to
compete.

That means they'll be throwing a LOT of money at the Jaguar, as a whole.
(sorry if I made it sound as if I had only meant R&D)

: done, finished, and shipping? That seems a little odd. You don't
: engineer the machine over after it ships (although you've suggested they
: do this to remove the 16 bit access to chip RAM in the Falcon :) ).

Actually, they probably should, several times. Keep cost reducing the
Jaguar, make it cheaper and cheaper with the same functionality and
compatibility, to compete more directly with everyone out there who does
the exact same thing. Reengineer it over, and over, and over.

: I don't that's a real problem. The Jaguar is aimed at one market, the Falcon
: at another. If one is more profitable, then they'll devote more resources to
: it, I'm sure.

To what extent, though? Will they kill the Falcon to save the Jaguar, if
the Jaguar grabs a chunk of the market?

Special Friday Night Real Time Conference
Dateline Atari! with Bob Brodie
July 9, 1993

Host - Lou Rocha

<[Host] ST.LOU> Good evening to all our loyal GEnie members and
welcome to the July session of Dateline Atari! with Bob Brodie. I
hope you all had a great holiday last weekend and I am very happy
you all made it back safe and sound. Tonight Bob will bring us up
to date on the industry-setting news about the Jaguar - Atari's
64-bit game console - and the very promising arrangement with IBM.
I am sure we will also hear the latest on Falcon computers and
applications. Of course, Bob will also be ready to answer any
Atari-related questions, right Bob? So without further ado.....
ROUND 10 of Dateline Atari! with Bob Brodie..........

<BOB-BRODIE> Welcome to the July installment of Dateline Atari! I
trust that you have all enjoyed last weekend's holiday time. My
family and I used it for a much needed "get away" time to step
back from things, and enjoy each other's company.

I had hoped tonight to be able to discuss the Atari Jaguar in more
depth than we've done in the past, but I've been unable to hook up
with our technical staff to get the kind of information for you
that I'd really like to have. So, while I'm prepared to field some
questions on the Jaguar, I'll ask you to be understanding if I
cannot be as forthcoming as I had hoped to be tonight.

We gave one of the first demos of the Atari Jaguar at our recent shareholders' meeting, where we showed our stockholders that "futuristic" style housing, as well as demonstrated some of the software titles that we're working on. Be sure to check the last issue of Atari Explorer Online Magazine for all the details on that meeting...they had an excellent reporter hidden in the crowd! Most of the details reported by AEO are right on target. Especially of interest to some of the attendees at the meeting was the fact that the Jaguar does in fact have a 64 bit data bus.

On the Computer side of our business, we're continuing to get shipments of the Atari Falcon030 Computer in good quantity. We have finally seen the first shipments of the 1 meg no hard disk machines, and the four meg no hard disk units. We're still on back-order for the RAM boards that we're manufacturing, but the developers are supplying our customers with high quality 3rd party boards. I stopped by B & C ComputerVisions earlier this week to catch a first hand look at the RAM Gizmo Board from CHRO Magic. This board accepts regular SIMM modules in it, and looks terrific! The suggested retail price of the board is $99, without SIMMs. B & C had already installed a 14 meg upgrade into one of the units that they had for sale, and seemed quite pleased with the results!

For our part, we have been shipping MultiTOS and SpeedoGDOS. We had been shipping Atari Works as part of the Falcon030 shipments, but hadn't gotten the manuals in. There has been a significant demand for Atari Works, and in our zeal to meet the demand, there was a mistake made in the final process of preparing the product to be shipped. It seems that rather than package the 720K floppies that we had manufactured to go in the stand alone Atari Works package, the units inadvertendly went out with the High Density floppies that were supposed to go with the Falcon030. We apologize for the problems...the stand alone version of Works wasn't really quite ready to go out the door. We were waiting for the boxes to be manufactured...and we're a little red-faced about the mistake. Greg Labrec is hustling to make things right, and I'm sure that we'll have this straightened out in short order.

Our current inventory situation on the Falcon030 is quite strong, and our dealer base is still growing, albeit mostly in the music side of the business. On the computer side domestically, we're pleased that we were visited by our friends from Holland, Compo Software last week. They are preparing to bring into the US their high quality PC board, Falcon Speed, as well as the exciting Overscan product called Screen Blaster. I expect that they will also be importing in the product NVDI, a high quality screen re-draw accelerator. They were kind enough to provide me with copies of these products, and they look terrific! The Falcon Speed Board is a very clean "plug and play" type of design, and the Screenblaster plugs in to your monitor port, and then a cable to one of the joystick ports. Very nice results, and fully programmable. Be sure to check with COMPO here on GEnie for the

pricing and availability of these products.

I had a lot more to say in my opening remarks, but a hard disk demon seems to have stricken them from my files....

<[sTTeve] S.MILLER58> So MultiTOS is available now for the TT?

<BOB-BRODIE> Yes Steve, it is shipping. Works great, I use it everyday at work. I believe that the MSRP is $69

<[Yat@Lexicor] Y.SIU> Thanks, one thing that many people are fearing is that Atari will be concentrating more on the Jaguar and neglect the Atari Computer's series for a while? I hope that this fear is unjustified. Also, how long will Atari take to produce an '040 Computer? it doesn't appear to be planned and this is part of why some of those fears emerged...also, how supportive is Atari about Atari Clones made in both Germany and U.S. (unofficial yet).

<BOB-BRODIE> Yat, we've made it very clear that we intend to support the Falcon for a long, long time. We've indicated to you personally, repeatedly, that we will not discuss future products that have not been announced, and that I am an employee of the US, and not preparted to discuss European issues...three months running now.

<[Yat@Lexicor] Y.SIU> It's not about Europe...

<BOB-BRODIE> There is no question that the Jaguar is an important product for our product line, and that the Falcon is as well. We took pains at our recent shareholders meeting to showcase both machines to ensure that our shareholders understood that we are supporting both of the products to the fullest.

The only reason that I can think of that you are saying that an 040 appears to be unplanned is that we're unwilling to discuss future products.

<[Yat@Lexicor] Y.SIU> Ok..thanks, what is Atari's viewpoint about Clone Computers about Atari?

<BOB-BRODIE> I assure you that as Sam has indicated in the past, the Falcon is the first in a new family of computers. There will be updates to the line, and we'll continue to make computers for quite a while to come. As far as the clones go, we've worked closely with most of the so-called clones, and they are in many cases just a repacked Atari.

<[Die/!\Hard] PRESS-20> Can you tell us more about the IBM-Jaguar deal. Seems to me to be one of the most significant developments of the decade for Atari. An American made entertainment console is going to make a wonderful Christmas present.

<BOB-BRODIE> The contract is for 30 months, IBM will be sourcing the parts, doing the Q/A, building and distributing the product from their warehouse in North Carolina. Can you be more specific in your question?

<[Die/!\Hard] PRESS-20> So question one: any more details? Okay, any chance that IBM would build Falcons and TTs?

<BOB-BRODIE> Not at this time, we have other contracts in place for that. In the future, it's a possibility.

<[Die/!\Hard] PRESS-20> Any chance that STBooks may make it into production?

<BOB-BRODIE> Right now we're focusing on the Falcon and the Jaguar, Donovan. We are aware of the demand for the ST Book, but think that it will need a lot more re-working before it will be ready.

<[Sean@TWP] P-DIRECT> Hello, Bob. Fairly easy question - any news on when the software for the upgrade cards with the Falcon030 will be shipped?

<BOB-BRODIE> The software is shipping now, Sean. We sent out a mailing today with the material in it for the dealers.

<[Sean@TWP] P-DIRECT> Great News, Bob. Thanks.

<[Jeff] J.WHITE99> Since there seems to be a lot of question tonight concerning the TTs can you update us on the status of a several week old rumor of TTs coming into Sunnyvale?

<BOB-BRODIE> Hi Jeff, it's not a rumor at all. We're bringing the TT back into production. We have been told by our corporate officers to expect TT's sometime next month.

<[Jeff] J.WHITE99> OUTSTANDING!!!!!!!!!!!!

<[Sam030] SAM-RAPP> Hi Bob! I picked up Battle Wheels for the Lynx yesterday! Great game! Any news on Daemonsgate or others? What about the Joy stick/pad for Falcon? Same as Jaguar? Available when? My dealer had no cards for missing Falcon Software! Also, I have had a bad HD in my Falcon for a month! Why can't Atari Get me a replacement?

<BOB-BRODIE> Hi Sam....I agree, Battle wheels is a terrific game. The next ones that you should expect to see on the shelf are Gordo 106, Lemmings, and then Jimmy Connors Tennis. Sorry, no comment about Daemonsgate, still in beta. The joystick pad for the Jaguar is the same unit as for the Falcon, only a different color. Your dealer can get the cards he needs for the missing Falcon software by contacting Greg Labrec at Atari for them, or myself.

Re the hard drive, we had a few problems with some hard drives, and the manufacturers were here at Atari trying to figure out what

the problem was. It didn't make sense to send out more until we determined what the problem was. There was a concern that it might have been a software problem rather than a hardware one.

<[Sam030] SAM-RAPP> When on Falcon stick? My HD problem was DEFINITELY hardware! (bump...grind... etc!)GA and thanks!

<BOB-BRODIE> You'll have the Falcon stick when the games that use it are available, Sam. All of the game manufacturers have them, we won't be the only ones shipping them...and I know that you think it was a hardware problem...so did everyone else. :( But there is more to it than meets the eye and that's why the drive mfgs were called in.

<[James] J.VOGH> Can you describe some Jaguar games and How well suited is the Jaguar for 2D games like SF2 and sonic? Also, What FCC class is the new TT?

<BOB-BRODIE>Hi James, take a look at the last Atari Explorer Online Magazine here in the libraries on GEnie. It has a piece in it about the shareholders meeting where it talks about the games. They are truly stunning.

The Jag is better than 2D, it is well suited for 3D games. I'm not sure what class the TT will be in when we get it...good question. I'll ask.

Sorry I don't have the file number handy...

<[James] J.VOGH> About, the 2D stuff, is the Jaguar good at that type of stuff if that is what you want to do? Parallax scrolling etc.)

<BOB-BRODIE> We certainly don't want to restrict the machine in any way, James. That's why we've designed it to interact with both phone systems via modem, and cable TV systems.

<[Robb @ PAC] R.ALBRIGHT7> Hi Bob. Do you know of any Falcon-aware games , i.e., 256 colour, 16bit sound, etc., available now, and upcoming? Also, will there be a change in the TT MSRP with the new shipment, you could sell some serious units at around Falcon price!. And finally, what is the best source for apps available for the Falcon, esp. video, maybe an updated TOS catalog (ther e was a date on it, suggesting revision :') )

<BOB-BRODIE> Hey Rob, yes we are indeed aware of some Falcon specific games. Most of them are coming here from Europe. They look terrific, and really, really SOUND incredible as well. The DSP is well suited to the sounds used by many of the leading game developers.]

Re the TT, we're going to hold off on any price discussions on that until they get in hand. We will be updating our dealers via mailings and faxes as the new products become available...that's

what we did with the Ram GIZMO and it seemed to work nicely. Our users will continue to get the latest in news on the exciting new games and other Falcon products from Atari Explorer Online Magazine, available here on GEnie.

<[Yat@Lexicor] Y.SIU> Concerning the Jaguar: How many game producers plan/are developing for Jaguar? Any Famous Names (aside from Atari <grin>)? Is there or will there be a CDROM and CDROm games? (excuse my ignorance if this is already known) and will Atari and IBM maybe team up on distributing the Jaguar i.e. Advertisement?

<BOB-BRODIE> No comment re the developers. Sorry. We plan on doing our own press on the Jaguar. If you're in the area of the roll out (New York or San Francisco) I'm sure you'll be impressed with the results of the TV (yes, television) advertising that we'll have for the Jaguar. If you are not in those target areas....get cable or read Atari Explorer Online. They'll probably have GIFs of the ads in their issue.

<[DAVE] D.MUNSIE> Hi Bob, I'll make these quick...Will the letters IBM appear anywhere on the packaging? Also how many active users (ST/STe here in the states now andd oes Atari encourage ST/STe development still? Thanks...

<BOB-BRODIE> ST development makes no sense at all, not enough colors, not enough sound. We've said for about three years now that our developers should be making STE or greater products. Via our developer newsletter we've provided guidance on programming for compatibility (authored by Leonard Tramiel no less)and it is an obtainable goal. I think that the Falcon offers such exciting new capabilities that it makes sense to program with those in mind. As far as the number of users, sorry....no comment. ga

<[Jeff] J.WHITE99> Is there going to be an official attempt to gain some exposure in popular trades(reviews, comments, honorable mentions,) like New Media or other cross platform mags - or would it be appreciated if an anonymous letter to the pubs. suggested that they investigate the Falcon and or other Products? Has anyone in Sunnyvale looked at what Cupertino is proposing with the "Cyclone"?

<BOB-BRODIE> Jeff, we have gotten such press in the past, albeit not in New Media. We have seen write ups in Computer Reseller News, a very prestigous industry publication. And yes...they are officially sanctioned actions. I helped. :) New Media is neat, but it's new. It hasn't even published for a year yet, so let's not annoint it to the level of the Info World et als just yet. ga

<[Rob C.] R.COOPER2> Bob, I've heard a lot of talk regarding Falcons without HDs not having the s/w pkgs. Could you comment on this? Is the software extra for those who don't require the HD

space? If so, why is that? [a soon-to-be Falcon owner :) ]
...BTW, thanks for taking the time out to do this. It's
appreciated!

<BOB-BRODIE> Hi Rob, the Falcons without HDs will ship without SpeedoGDOS, Works, or Falcon D2D. The reason is that's part of the incentive to purchase the machine with the HD...that software will be pre-installed at the Factory (eventually), so there will be no need to include the floppies with the units. BTW, I enjoy this time, too. :)

<S.MERRILL1> What speed does the Jaguar run at?(mhz)

<BOB-BRODIE> Sorry, that's part of the info that I'd hoped to have on hand, but couldn't get together with our staff to have available for you tonight. Hopefully, we'll have a full spec sheet available soon. Look for it in the library, as well as in a future edition of Atari Explorer Online Magazine.

<[Die/!\Hard] PRESS-20> One question: What's the status of Atari Explorer, the magazine?

<BOB-BRODIE> Still up in the air. We had a proposal to have it done by Lindsay and company on the outside that looked like it was going to fly, but was rejected at the last moment. Not sure why.

<AEO.4> I was impressed by the article in "Electronic Engineering Times" dated July 5, 1993. Have you seen it? They gave a very positive view of the Jaguar, comparing it to mid-range 3-D workstations in power! It's nice to hear some positive news. I am new to the RT, having just come on to AEO. I write the article, "The Unabashed Atariophile."

<[Yat@Lexicor] Y.SIU> I read in STFormat issue 47 (june 1993) that the 520STFm is being reintroduced? I hope that isn't true....? Thanks

<BOB-BRODIE> Hi Yat, I read that too. Garry Tramiel and I had a good laugh about it. No, it's not.

<[Robb @ PAC] R.ALBRIGHT7> Bob, I realize it is still early in the game, but have there been any discussions with developers from IBM/Mac with established software about porting to the Falcon? Also, do you have any _names_ of the Falcon games I asked about before?

<BOB-BRODIE> Rob, most of the developers from the IBM/Mac world are going to want to see better sales of Falcons before they will be willing to port their stuff. We're continuing to work with our excellent developers association, The IAAD, to get the highest quality software produced for our customers, and our machines. We're grateful that we have such a dedicated organization of professionals to work with. re the game titles, hmmmmmm nah.

Better not. :)

<ARCHIVIST> Bob, just a little question about the IBM deal. Will they be making only the basic Jaguar or will they also be responsible for the add-on's like the CD-Rom, joypad, etc

<BOB-BRODIE> Good question, Charlie. To be honest, I'm not 100% sure. But in the past, we've always handed off the entire product line to a specific manufacturer. ga

<[David] D.FREELAND> Hi Bob. I just got my F030 about a week ago and after looking at the machine, speedo GDOS and Atari works, I am sure Atari is on its way to reclaiming a good portion of the market and attracting some NEW users to the platform. I was wondering what kind of incentive is Atari giving to make their programs work on the F030.

Also,is there any truth to the ST Format article that states Atari is projecting the sale of 100,000 F030's by Christmas?

<BOB-BRODIE> Basically, we're providing developers with an environment to produce products that are not possible to do on other machines right out of the box. Like Digital Sound, and other DSP kind of things. By giving them hardware that they can be creative in, we feel that we will continue to attract some of the very best/innovative minds in the world. Re the ST Format article, I'd rather not comment on that, since I haven't seen the article in question yet. I enjoy a pretty good relationship with ST Format, and don't know what their source was, or their intention...ie UK, Europe, worldwide, etc.

<[Chris] C.CASSADAY> The recent upload of the Develper CD ROM info gives some light to the possibility of new developers coming on board to the Atari platform. At least it gives the appearance that Atari recognizes the need to increase developer support in order to attract those folks... I know personally that Mike Fulton helped me out quite a bit a few weeks ago when I needed some help.

<BOB-BRODIE> Hi Chris, this is a project that we've wanted to do for a long time. You're right, we're certainly aware of the increase in support that is needed.

<R.HOUSE4> Three questions Bob - Do you have any information on 'Falcon Speed 486'? Are you aware of any Falcon specific accelerator boards? Lastly, is there any plan to standardize the look and feel of Atari specific software packages similar to Windows and Mac applications to their respective platforms?

<BOB-BRODIE> I personally own a Falcon Speed 286, I've been asked not to comment on the 486 product at this time. Yes, there is an accelerator board, I believe it is from Overscan, but not 100% certain about that. I was told that it was a 48Mhz board. Re the standardization...that is something that Bill Rehbock took up once

upon a time. It didn't meet with a lot of success. In Europe, they have an extra key to contend with that tends to mess up some of the common key combos that we'd like to see. Like using the ALT key for instance. It's evil. :) But certainly common things, like Control-O to open a file, that sort of stuff...should come in time.

<C.S.SMETON> Bob, Sales via the Distribution system have almost reached a standstill. Does Atari have a list of the 140+ Falcon approved dealers that you can give to developers for direct marketing?

<BOB-BRODIE> Charles, at this point I have been instructed not to release that list. Sorry. We are discussing other methods with the IAAD to aid in the sales, like putting them in contact with our rep firms to ensure that the reps are aware of the third party solutions that are available on the computer side of the business. Most of them have a high level of expertise on the music side, but couldn't un-lzh a file if their life depended on it. Or unzip one, right Jeff? <ducking>:-)

<C.S.SMETON> Bob, I would not expect a music dealer to un-zip or un-lzh a file. I just want to directly contact them about our products. How many of the Falcon ADA dealers are music specific or music intensive and how many are true computer stores? How does a user know where they can buy aFalcon?

<BOB-BRODIE> Charles, understood. My point is that since I cannot release the list directly, I want to do the next best thing...make sure that our sales reps can inform dealers of your products in a proper fashion. It's going to be an educational process for them, they are largely musically inclined. The dealers are running about 3-1 Music. A user can know where to buy one by contacting Atari, or by looking for a dealer's advertisment.

<[Splat!] DMJ> First, I heard a rumor that one dealer has 500 Falcons. If this is true, it's good news. I also read the Developer's CD info; it looks good.

<BOB-BRODIE> Not true.

<[Splat!] DMJ> Not true about the 500 Falcons? Oh well.

<BOB-BRODIE> 50 maybe, not 500. Sorry. Actually, most of the dealers report that their shipments come in, and go out pretty quickly.

<[Splat!] DMJ> Okay... about how much will the Developer CD cost?

<BOB-BRODIE> Sorry for the delay, had to double check with the Dev guys on that. No price has been announced at this time.

<[DAVE] D.MUNSIE> Bob, as a writer for a European magazine (ST REVIEW) I have to clarify this. When you said you laughed about

the ST Format article about the re-release of the STFM's are you going on record as saying there is no truth to that article what so ever? A lot of people in the media in the UK seem to think it's true. Thanks.

<BOB-BRODIE> Dave, when I was told about the rumor, I asked my immediate superior, Garry Tramiel. He is well informed on our companies plans world wide. He indicated that it was not true.

<[Host] ST.LOU> Well Bob it has been another wonderful evening and I would like to thank you for staying well beyond our usual time. Best wishes in the days ahead and I hope you get to spend some summer time with your family!

<BOB-BRODIE> Thanks, Lou. It's always a pleasure to spend this time on GEnie, our official online service with our users. I really look forward to this event that we've come to share each and every month exclusively here on our online network of choice, GEnie!!! I'm off to a weekend with my family for some of the summer fun, and hope that the rest of you have a wonderful weekend as well. Good night!!!

**********

Well, that's it. Hope this has helped clear up some rumours. If anyone's interested, I'd be happy to post the results of future conferences on GEnie as well. Let me know via mail, garth@splunge.uucp.

Guess what, Greg? That's speculation!!!!!!! :)

This is akin to me saying that Commodore would cease making high-end Amigas
(i.e., the A4000 series) because the A1200 and CD32 sell more units and so on.
We all know the main Amiga sales have been in the under-$1000 category. So
why do they even presume people would support their high end efforts? So why
not dump the high end Amigas after losing $177 million internationally and
being known as the 2nd worse managed company in the Western Hemisphere? :)

(the 1st being Atari :) )

>system made by the ol' Amiga crew has ever done well.
>

Well, that's true.... to an extent. If I remember correctly, many of them
were ex-Atari employees who helped out in the design of the Atari 8 bit, which
did quite good for a while. Until the C64 began to dominate the market, the
old 400/800/1200/XL machines were doing pretty good...

>First, they make the Amiga. Then they run out of money, and C= buys it.
>Relatively speaking, it flops.
>

Hmmmmmm. I wish you'd mentioned that when you were hyping how great the A1200
was in terms of software and support earlier. If I'd known it was a flop I
would have proclaimed victory in this discussion oh so much sooner. :)

>Then, they make the handheld system, later to be dubbed Lynx. Epyx runs
>out of money, Atari buys it.
>Relatively speaking, it flops.
>

Yep. Poor Atari. :)

>Now, they've got their hands in 3D0...
>
>I wanna know if it flops. Somebody flip to the last 10 pages of the book

>

The big difference between 3DO and the rest is simple: software. EA is
committed to it. They are big. Mammoth. Gigantic. Not on the order of
MS yet, but 3DO is their IBM PC. They wanna ride its coat-tails to glory.
Trip Hawkins wants to use 3DO to put EA in the same leauge as MS.

At $200 they won't need to devote a massive effort to re-engineering the
Jaguar initially. And it's pointless to throw money into it before you
know enough units will sell of the machine to justify keeping it competitive.

: >whether or not you could get 32-bit access to TT ram on that bus is very,
: >very questionable. That expansion setup is a straight 68000 set of
: >traces. Any CPU on the motherboard would only be able to access anything
: >in that expansion port in 16-bit increments. That doesn't even include
: >the fact that they've got a 16-bit bus to memory on that cpu, and the
: >fact that it's very likely that they've only put 16 bits of address as
: >well, to save board space (because it would be unneeded).

: Ummmmmmm..... now, this is where we go into dangerous territory, so let's ask
: the people who know. :)

: First of all, you are ASS-uming :) that the 128MB 32mhz 030 expansion goes
: on the 16-bit (ugh!) slot which has 24-bit addressing in the Falcon. But
: it might be a soldering hack 'n slash upgrade. The company's name is GESoft

See, there's no reason. The 16-bit slot won't affect it WHATSOEVER.
You'll be accessing the motherboard at the same rate you would with a
hack and slash.

Seem, the problem is that you've got 16 bits of address, nearly all of
which is taken up by the system itself. You can't add ONLY fast ram to
the slot, because it wouldn't BE fast ram--you could only access it 16
bits at a time.

What you CAN do is do what was done with the Amiga on the old 16-bit
systems. Put a new processor on the same board as the memory, access
that memory at the full 32 bits at full speed, and drop back to access
chip ram.

So, it's perfectly possible and logical that it goes in the slot.

: For now, let's go to the facts... the board goes in the Falcon, gives it up
: to 128MB of RAM, most or all of which is known to be TT (CPU-only) RAM. This
: increases performance as this RAM would be accessed 32-bits at a time... with
: no contention with the remainder of the Falcon's chipset.

But it does so by adding a new CPU. You're not really adding ram, you're
adding a new subsystem. When I say "stick ram in the slot", I mean ONLY
ram. You can't add FAST ram to a Falcon, you've got to add Fast ram with
a new processor in order to access it at a faster speed. (And yes, I'm
much more coherent today. Much better grasp. ;)

: Greg, you're grasping at straws, trying oh so hard to flame when you don't
: have facts. Please do more research. If this were a court of law, this

I was trying to think it through logically.

: evidence would be thrown out as mere speculation. And if you're speculating,
: and spreading it as if it were the gospel, you're misleading people.

Okay, I'll take it down, and this time, step by step.

FACT 1: The falcon allows for 16-bits of address.
FACT 2: The Falcon's processor slot is a collection of 68000-compatible
signals pulled from the motherboard.
FACT 3: The Falcon's architecture maps out the entire 16 megabytes for
use, dedicating some portion of that to the expansion slot.

Now, here's where we get technical.

Postulate 1:
From FACT 2, we see that it is not possible for the on-board CPU to
access TT ram with any speed, becuase it would be restricted to 16-bit
access.

Postulate 2:
From FACT 3, we see that there isn't ROOM in the memory map to add any
sizeable amount of ram via the processor slot, and for a very good
reason--the reason it IS the way it is _IS_ because they worked so hard
at compatibility with their old architecture.

Conclusion 1, based on Postulates 1 and 2:
Therefore, it isn't possible to add TT ram without moving the processor
off of the motherboard. This can be done by designing it into the TT-ram
card and giving it full access.

And, here's something that Amiga users that used to own the old 16-bit
systems will appreciate.

Conclusion 2, based on FACT 2, FACT 3, and Postulate 2.
Because of FACT 2 and FACT 3, we see that it is impossible to use DMA to
get to TT ram. The DMA system is motherboard-based, and therefore,
cannot even SEE the TT-ram, which is totally out of its address range.

Crippled, plain and simple. All created by that 16-bit bus.

Conclusion 3, based on Conclusion 2:
Because of the nature of the SCSI-II controller, and its inability to
reach TT ram, any access to the drive must a) take place in ST-RAM,
slowing the system down considerably, and b)become, as a result, polled
IO when transferring anything from the drive into TT-RAM.

Conclusion 4, based on Conclusion 3:
So in order to get any good system throughput with a TT-RAM/processor
fitted system, you'll have to add a new SCSI connector on the local area
of the processor (which means, in effect, you've got to stick it on that
card with the ram and the processor).

None of this is new to Amiga users. The _EXACT_ same problems were encountered by A2000 and A500/A600 owners when they wanted to upgrade, and the multifunction cards came into existence rapidly. With the smaller market of the Falcon, there will be a greater amount of time, but that whole ordeal was the reason a lot of people upgraded to the A3000--to end that problem.

Greg

In article <21k8u4INN78e@mojo.eng.umd.edu>, Gerry Mon (gerrymon@eng.umd.edu) wrote:
: When you say 16-bit memory, what do you mean? Is this the Chip RAM on
: the A500's motherboard? If so, then this is precisely the reason why
: I feel that accelerators such as the megamidget racer is a poor
: example.

: Sure the 68030 is crippled to a crawl. It not only has to go through
: a 16-bit bottleneck but it has to talk to memory that was designed
: for a 7.16 Mhz (or something like that) 68000 -- not a 38 Mhz 68030!

Except that BOTH systems, in this case, are limited by their respective
chipsets as to how fast they can access memory (which is why it only gets
about 4mb/s access). BOTH systems are limited to accessing that ram in
16-bit widths.

: In other words, there are two bottlenecks. The speed of the memory
: chips _and_ the 16-bit data path. That's why you guys are
: experiencing 4 or 5 times the slowdown.

We're not. Again, it's a problem of the nature of the shared bus, shared
by BOTH machines.

: I'm claiming that the Falcon030 is more like the Mac LCII. In that
: situation, the original 16-bit Mac LCII only experienced a 15% to
: 30% slowdown from the newer 32-bit Mac LCIII.

And that's because most code on the Mac runs out of the Toolbox, which
resides in the rom--and is 32 bits wide. Which makes it faster than the
actual ram in the system.

Which is why the Mac is nothing like the Falcon.

Additionally, the Mac still doesn't take shared ram into account, it uses
VRAM; the Falcon has to deal with a shared bus, owned by the chipset and
not the processor, just as the Amiga does.

I would hope so, because the only way you can have fast ram on a Falcon
is to upgrade the system so that the processor is local to the ram (that
means sticking it on the same card. ;)

With the A1200, you can stick fast ram, ALONE, right in, and have it go
faster than the chip.

: This is what the Falcon does OUT OF THE BOX. :)

Runs like a snail, and becomes instantly impossible to upgrade, that is.
;)

>
>Okay, I'll take it down, and this time, step by step.
>
>FACT 1: The falcon allows for 16-bits of address.

Wrong. 16-bits of data. 24-bits of addressing.

16-bit address is 64k. This is not the Falcon 64, but the Falcon 030. :)
And you said you were coherent when you wrote this! Liar! Blasphemer! :)

But yeah, the Falcon, as it is designed (flawed? :) ) allows the 68030
to access system RAM 16-bits at a time.

No provision for FastRAM is available (as far as I know of) without using
some kind of 3rd party solution which also involves upgrading the CPU.

However, and this has been my main point, as pointed out by others, A1200
users have been availaing themselves of the option of doing just that...
upgrading their CPU with something like the CSA board to 50mhz 68030s. So
even though the A1200 is "just a brain dead EC020" we both know it can
be taken to far beyond that, and I believe even to '040 levels. The Falcon
is similar in that expansions exist NOW that can add the capabilities we've
been discussing, and since these are legitimate expansion options for users,
then they too reflect on the capabilities of the system.

>FACT 2: The Falcon's processor slot is a collection of 68000-compatible
> signals pulled from the motherboard.

This is correct. You're 1 out of 2 so far. :) But consider also that
this is done to make it easier to port from the MegaBus (A24/D16) and the
Mega STe VME (A24/D16) to the Falcon the various expansions out there. To
wit, some video add-ons have already been ported to the Falcon from the
aforementioned systems.

>FACT 3: The Falcon's architecture maps out the entire 16 megabytes for

Well, remember a while ago you said you could throw money at the I/O problem
and the Falcon owner couldn't throw it at the 16-bit access "problem"?

Well, if he/she does and gets a board with a new CPU (not the on-board CPU,
granted) your Postulate 1 is rendered (i love this word) irrelevant.

:)

>
>Postulate 2:
>From FACT 3, we see that there isn't ROOM in the memory map to add any
>sizeable amount of ram via the processor slot, and for a very good
>reason--the reason it IS the way it is _IS_ because they worked so hard
>at compatibility with their old architecture.
>

That may indeed be correct. However the GESoft board comes with the ability
to slap in 128MB of RAM.

Also, remember if we're discussing built-in features, the EC020 in the
A1200 only addresses 24-bits (16MB) and you have to make provisions for
PCMCIA and your own ROMs. I am not sure about your 32-bit slot, so I will
refrain from speculation <-- I set an example. :)

>Conclusion 1, based on Postulates 1 and 2:
>Therefore, it isn't possible to add TT ram without moving the processor

>

Conclusion 1 is correct! Wow! You get a Doctorate Of Advocacy (DOA) and
a free trip to the next C= board meeting in the Bahamas, where they will
no doubt make you feel at home! :)

But as stated earlier, this is a legitimate upgrade path available now to
Falcon owners, so it makes the importance of the other problems less
relevant as it can be "solved", much in the way the complaints others made
about the lack of a DSP, SCSI, and other I/O and features on the A1200
can be solved with money... even the pesky clock. :)

>And, here's something that Amiga users that used to own the old 16-bit

>

Well, let's take this a step further.

By the definition of your chipRAM on the A1200, how would the DMA system see RAM in the rest of the machine? The custom chips cannot read or write to the system RAM, correct? How is this problem solved on the A1200? Can these chips reach into FastRAM?

>Crippled, plain and simple. All created by that 16-bit bus.
>

I love it when you're so authoritative, Greg. :)

>Conclusion 3, based on Conclusion 2:
>Because of the nature of the SCSI-II controller, and its inability to
>reach TT ram, any access to the drive must a) take place in ST-RAM,
>slowing the system down considerably, and b)become, as a result, polled
>IO when transferring anything from the drive into TT-RAM.
>

That's an interesting point. However, consider this also:

Unlike the Amiga, our "chipRAM" can go to 14MB. We also have the ability to determine (for compatibility OR speed) whether a program loads into the 14MB of 16-bit RAM accessible by DMA or whether it loads into TT-RAM (see TT docs for details and a free gift!). This means that if a disk intensive process is running and it does little computationally with the '030, the user can decide to run this application in the 14MB of RAM available to the chips.

Ideas for such uses: direct to disk recording, effects processing, etc...

14MB is ample space for such applications of 1993. :) In 2003 we'll all think of 14MB the way we used to think of 48k. :)

1) So far, the only A1200 configuration I know of is a 2MB system loaded with chipRAM and no FastRAM.

2) The only Falcon configuration I've seen in the USA is the 4/80 systems.

3) Out of the box the Falcon is allegedly 15% faster (in terms of CPU performance, despite the 16-bit bus).

I may be incorrect about 1) but hey, there aren't that many Amiga dealers around advertising any other configurations. :)

(Does C= in fact sell an A1200 with FastRAM standard? And how much is the MSRP?)

In article <21mude$i77@cville-srv.wam.umd.edu>, 'Flip' Medley (cmedley@wam.umd.edu) wrote:
: Guess what, Greg? That's speculation!!!!!!! :)

Absolutely.

: This is akin to me saying that Commodore would cease making high-end Amigas
: (i.e., the A4000 series) because the A1200 and CD32 sell more units and so on.

No, that's different. Consolidating one line to feed a totally different
line of products is a lot different than removing a member of a line.
See my point?

: But Greg, Greg, Greg... my boy... they apparently have planned to support both!
: So sit down, rest easy in your chair, and don't worry... it's not your money!

No, it could be yours. One cannot say which directions a company whose
CEO's are as unpredictable as ours will do. They may just go for the
bucks, and there are more bucks in Jaguar, for the moment.

: And that is precisely why your speculation on future events is so...
: unwarranted.

It's an advocacy group! If you can't do it here, you can't do it
anywhere. And since what I'm saying is _OBVIOUSLY_ speculation I see no
problem in it.

Remember, YOU'RE the one making the buying decision, you're the one that
has to decide whether or not you'll be getting what you want in the
computer system you buy.

: Hmmmmmm. I wish you'd mentioned that when you were hyping how great the A1200
: was in terms of software and support earlier. If I'd known it was a flop I
: would have proclaimed victory in this discussion oh so much sooner. :)

4 million is a flop, as far as the world of computers go. If you can't
interest the big guys, you don't have a large enough user base.

And everyone here knows that the Amiga doesn't have a large enough user
base, that isn't news.

: The big difference between 3DO and the rest is simple: software. EA is
: committed to it. They are big. Mammoth. Gigantic. Not on the order of
: MS yet, but 3DO is their IBM PC. They wanna ride its coat-tails to glory.
: Trip Hawkins wants to use 3DO to put EA in the same leauge as MS.

We'll see. ;) I'd like for it to succeed.

: Excusez moi, but your original posting said R&D. Go back and check (unless
: you cancelled it out of embarassment!).

Embarassment. :)

: My argument was that R&D time on the Jaguar is OVER. The machine is complete.
: The issue now is marketing, as you so correctly point out. :)

My bag. It was late when I wrote the original. If they can cannabalize
the Falcon for the sake of the Jaguar, and succeed with the Jaguar, you
can bet they'll do it.

: At $200 they won't need to devote a massive effort to re-engineering the
: Jaguar initially. And it's pointless to throw money into it before you

Unless they're eating the machine at that cost. Who can say if they're
making a respectable profit. If they pull a profit, they can pull MORE
profit by reengineering it as soon as possible, doing a cost-reduced
version.

Greg

: >
: >Okay, I'll take it down, and this time, step by step.
: >
: >FACT 1: The falcon allows for 16-bits of address.

: Wrong. 16-bits of data. 24-bits of addressing.

My god, I've gone 16-happy. Okay, translate. :)

: But yeah, the Falcon, as it is designed (flawed? :) ) allows the 68030
: to access system RAM 16-bits at a time.

Address; not data. There's 24-bits of ADDRESS.

FACT 1: The falcon allows for 16-MB of address space, 24 bits. Okay.

: No provision for FastRAM is available (as far as I know of) without using
: some kind of 3rd party solution which also involves upgrading the CPU.

Because it isn't POSSIBLE, that's why. There's no room in the address
space to add FastRAM because that could interfere with ST compatibility,
I imagine. The addressing range of the ST is protected from being TT ram
by nature.

: However, and this has been my main point, as pointed out by others, A1200
: users have been availaing themselves of the option of doing just that...
: upgrading their CPU with something like the CSA board to 50mhz 68030s. So

But they don't _HAVE_ to. They can outrun a falcon for much less cost
simply by putting real fast ram into the system.

Sure, the Falcon can have an accellerator dropped in. Then again, so can
the 1200. But a Falcon owner doesn't have the OPTION.

: even though the A1200 is "just a brain dead EC020" we both know it can
: be taken to far beyond that, and I believe even to '040 levels. The Falcon

Of course.

: is similar in that expansions exist NOW that can add the capabilities we've
: been discussing, and since these are legitimate expansion options for users,
: then they too reflect on the capabilities of the system.

And the higher you take the Falcon, the more you'll feel it.

: >FACT 2: The Falcon's processor slot is a collection of 68000-compatible
: > signals pulled from the motherboard.

: This is correct. You're 1 out of 2 so far. :) But consider also that
: this is done to make it easier to port from the MegaBus (A24/D16) and the
: Mega STe VME (A24/D16) to the Falcon the various expansions out there. To
: wit, some video add-ons have already been ported to the Falcon from the
: aforementioned systems.

I'm sure, but again, these are merely facts.

: >FACT 3: The Falcon's architecture maps out the entire 16 megabytes for
: > use, dedicating some portion of that to the expansion slot.

: You're 2 out of 3! .667!

: >Now, here's where we get technical.
: >Postulate 1:
: >From FACT 2, we see that it is not possible for the on-board CPU to
: >access TT ram with any speed, becuase it would be restricted to 16-bit
: >access.

: Well, remember a while ago you said you could throw money at the I/O problem
: and the Falcon owner couldn't throw it at the 16-bit access "problem"?

It can't.

: Well, if he/she does and gets a board with a new CPU (not the on-board CPU,
: granted) your Postulate 1 is rendered (i love this word) irrelevant.

No, it's not. You can never leave behind ST ram. Anytime you access the
custom chips, anytime you use the DSP, any time you access the HD, every
time you need something from the HD in TT ram, you fall back to ST ram.

Unavoidably. And in that, you cripple your computer system. It would
only be irrelevant if the TT ram was a "replacement" for ST ram, and it
isn't.

: >Postulate 2:
: >From FACT 3, we see that there isn't ROOM in the memory map to add any
: >sizeable amount of ram via the processor slot, and for a very good
: >reason--the reason it IS the way it is _IS_ because they worked so hard
: >at compatibility with their old architecture.

: That may indeed be correct. However the GESoft board comes with the ability
: to slap in 128MB of RAM.

Because the processor is, of course, local to it. It's not restricted by
the motherboard's addressability.

: Also, remember if we're discussing built-in features, the EC020 in the
: A1200 only addresses 24-bits (16MB) and you have to make provisions for
: PCMCIA and your own ROMs. I am not sure about your 32-bit slot, so I will
: refrain from speculation <-- I set an example. :)

And yet, you can add FAST ram into that system without compromising the system. And any accelerator put in can access chip ram in full 32-bit width, which is a big boon for the 030, a bigger one for the 040, and an even bigger one for the 060 when it's released.

: >Conclusion 1, based on Postulates 1 and 2:
: >Therefore, it isn't possible to add TT ram without moving the processor
: >off of the motherboard. This can be done by designing it into the TT-ram
: >card and giving it full access.

: But as stated earlier, this is a legitimate upgrade path available now to
: Falcon owners, so it makes the importance of the other problems less

It is the ONLY path. You MUST add an accelerator to get fast ram. It's one less option, and one that people that don't have a lot of money for a whole accelerator but want the speed fast ram would give should consider.

: relevant as it can be "solved", much in the way the complaints others made
: about the lack of a DSP, SCSI, and other I/O and features on the A1200
: can be solved with money... even the pesky clock. :)

And if you EVER get an accelerator, that SCSI is going to suck...

: >Conclusion 2, based on FACT 2, FACT 3, and Postulate 2.
: >Because of FACT 2 and FACT 3, we see that it is impossible to use DMA to
: >get to TT ram. The DMA system is motherboard-based, and therefore,
: >cannot even SEE the TT-ram, which is totally out of its address range.

: Well, let's take this a step further.

: By the definition of your chipRAM on the A1200, how would the DMA system
: see RAM in the rest of the machine? The custom chips cannot read or write
: to the system RAM, correct? How is this problem solved on the A1200? Can
: these chips reach into FastRAM?

The most obvious reason that the Falcon's DMA system is inapable of seeing TT ram is because the motherboard doesn't provide more than 24 bits of addressability, the only time that the dataspace widens out is on the accelerator's side of things.

That doesn't exist on the Amiga; DMA can take place within the full range.

Do note, however, that the same problem WILL exist on the 1200 when you go over the addressability of the motherboard.

: I love it when you're so authoritative, Greg. :)

(blush) oh, you kinky devil. ;D

: >Conclusion 3, based on Conclusion 2:
: >Because of the nature of the SCSI-II controller, and its inability to
: >reach TT ram, any access to the drive must a) take place in ST-RAM,
: >slowing the system down considerably, and b)become, as a result, polled
: >IO when transferring anything from the drive into TT-RAM.

: That's an interesting point. However, consider this also:

: Unlike the Amiga, our "chipRAM" can go to 14MB. We also have the ability

Great, 14MB of slow memory. ;)

: to determine (for compatibility OR speed) whether a program loads into the
: 14MB of 16-bit RAM accessible by DMA or whether it loads into TT-RAM (see
: TT docs for details and a free gift!). This means that if a disk intensive
: process is running and it does little computationally with the '030, the
: user can decide to run this application in the 14MB of RAM available to the
: chips.

: Ideas for such uses: direct to disk recording, effects processing, etc...

Absolutely. The same ability exists on the Amiga. However, those
programs will end up slowing down the entire system, because every time
they're task is switched in, whatever CPU you may be using becomes
bottlenecked by the slow 16-bit bus provided by the ST ram.

And any Amiga owner who owned an accelerated a2000 knows that it's much
better to just keep the program in the fastest ram you've got, and let it
drop back, because it would be slower to keep it in the slow stuff.

Because of the SCSI situation, you'll see the % CPU usage go up
DRAMATICALLY with HD access when working in Fast. A program could simply
set up its disk buffers and work out of those in chip; however, that
won't help you when applications are being loaded, saved, or when your
data is in the fast ram.

: 14MB is ample space for such applications of 1993. :) In 2003 we'll all
: think of 14MB the way we used to think of 48k. :)

Very likely. :)

Greg

> True, but the bus-contention is not heavy (on the A1200) with an inter-laced
>screen. Also, you can use sprites, depends on the type of game you are making.

Not heavy? Wait a minute. The AGA chipset has a max. rez of about
1440*240*8@60Hz =>19.8 megs/second
This means full bus contention, the Amiga guys here tell me, at least if
HAM-8 and 256colours have the same bus contention (seems so :-)).

320*200*8@60Hz =>3.7 megs/second => ~20 percent bus contention

Okay, that WILL be enough for games.
But HAM-8 requires some more calculations because the colours influence each
other, that's why there won't be too many games using it. But this mode is
great for background graphics, at least. BTW, what are the specs for
sprites/bobs on the Amiga, are they independent from the background?

BTW: F030 graphics in comparison:

(Note: the built-in hard-/software does not give you that many modes where
you can use the bus to its limit, so I took the Screenblaster data I found
in an Atari mag)

1152*832*4@87Hz/2 =>19.9 megs/second
1024*656*4@61.4Hz =>19.6 megs/second
800*608*8@55.2Hz =>25.6 megs/second
896*496*8@60Hz =>25.4 megs/second
512*400*16@65.1Hz =>25.4 megs/second

Nope, using the fastest drive available would be necessary to compare
controllers. And I doubt Atari users have the money to hook an SCSI-II
drive to the Falcon. Has anyone out there made a speed test using e.g.
a Quantum LP240S?

This functionality is built into the 030 (and 020). It is called dynamic bus sizing. The CPU can accept 8, 16 or 32bit wide memory, when the memory responds with a width information on the DSACK[01] lines the CPU reruns the cycle with an updated address for the next bytes until everything is read in.

> Anyhow, if you had VERY fast RAM (i.e. 10 to 20ns) there would be no

That would indeed require an external memory controller as the 68030 will run a cycle in 3 clocks at best. There's the faster 2 clock synchronous cycle and the even faster 2-1-1-1 clock burst cycle, but both apply to 32bit ports only.

Well from what I read in the papers last week, that is here in N.Z.
B&C got robed of all its Rams...

They were stating this was a new type of crime in the USA..

any one like to comments on this one..??

may be Atari did so that the Falcons will be delayed again..??

or was it because they needed the Rams them selfes..:-)...

Roger.............. sheppard_r@kosmos.wcc.govt.nz

>

What is it are you trying to say? Are you saying that the Falcon030's
68030 is slowed down by 400% to 500% because of the 16-bit
CPU to ST-RAM memory interface (as in the case of the accelerated
A500 forced to use 16-bit memory)?

I just don't see this. To me, it should only be at most a slowdown
of 100% (i.e. twice as slow). And because of the 68030's cache, the
real world slowdown would be even less. For example, if the cache had
a 70% hit rate, then we would only experience a slowdown of 30% --
just like the Mac LCII.

What I'm trying to say is that the use of a 16-bit CPU to ST-RAM
interface, while unfortunate, is not as bad as you guys are making it
out to be. The Falcon030 is not "crippled" by 400% to 500% like an
accelerated A500 forced to use only 16-bit ram.

If anything, a bigger drawback on the Falcon030 is the lack of a
provision to add TT-RAM (FAST-RAM in your lingo). But there are
third party products which allow for this (but like you said, you
are basically adding a new processor with it too).

So, in summary what I'm trying to say is this:

Both the A1200 and Falcon030 have shared RAM. The A1200's CPU has
32-bit access to this ram while the Falcon030's CPU only has 16-bit
access. However...

The use of a 16-bit CPU to ST-RAM interface only imposes a real
world slow down of 15% to 30% on the Falcon030. At most, we would
experience a slow down of around 100%. If I remember correctly,
even if it had a 32-bit CPU to ST-RAM interface, it still couldn't
take advantage of the 68030's burst mode since this memory is
shared.

So, in terms of shared RAM, the A1200 and the Falcon030 are about
equal in my opinion. The 16-bit bottleneck on the Falcon030 is
partially offset by the 68030's cache and slightly faster clock speed.

The big advantage the A1200 has over the Falcon030 is its ability to
easily add FAST-RAM to it. However...

If you want to have the advantages of TT-RAM (FAST-RAM) on the
Falcon030, you can buy one of the accelerators available from a
third party. This is similiar to the ability of an A1200 owner to
later add a DSP to their computer.

It seems to me that a Falcon030 with TT-RAM (through the use of a
third party accelerator) isn't that much different from an A1200.

In my opinion both the A1200 and Falcon030 are fine machines (although
I don't like the shape of the Return key on the A1200 ;-)). I just
wish you guys weren't trying so darn hard to put down the Falcon030.

>: I'm claiming that the Falcon030 is more like the Mac LCII. In that
>: situation, the original 16-bit Mac LCII only experienced a 15% to
>: 30% slowdown from the newer 32-bit Mac LCIII.

>Which is why the Mac is nothing like the Falcon.
>

I've never understood this claim of yours. To me, the Mac OS and GEM
on the ST are remarkably similiar. The ST ROMs contain the VDI
(analogous to Quickdraw) and the GEM AES libraries. These libraries
are responsible for menus, windows, dialog boxes, handling of
resources and events etc. Both are event driven environments where a
typical program just sits in a loop waiting for events to occur.

Isn't this essentially what the Mac Toolbox is? In my opinion, most
code on the ST make heavy use of the GEM libraries (Toolbox) too.

>HAM-8 and 256colours have the same bus contention (seems so :-)).

>320*200*8@60Hz =>3.7 megs/second => ~20 percent bus contention

This would be true if 1440*240*8*60 Hz would be everything. Taking account
for blanking intervals will yield exact figures for memory bandwidth. Plus
'contention' does not mean 'used bandwidth' IF the other side couldn't
use that bandwidth anyway. 320x200x8 steals as many cycles from the CPU
as would a disabled display, i.e. none.

>But HAM-8 requires some more calculations because the colours influence each
>other, that's why there won't be too many games using it. But this mode is
>great for background graphics, at least.

No, it also works fine for precalculated images as in cell animations.
You can defeat the pixel dependencies to the background by using the
64 independent colors that are available in HAM8.

>BTW, what are the specs for
>sprites/bobs on the Amiga, are they independent from the background?

Sprites: Yes. Bobs are objects drawn onto the background.

>512*400*16@65.1Hz =>25.4 megs/second

As I said, you have to take account for blanking intervals. And this bandwidth
is just available for graphics refresh in the Falcon. You can't share it
with the CPU. The theoretical limit for the Falcon CPU is 10,7MB/s. I believe
a real Falcon offers is less (at least in a mode like 512*400*16).

: A500 forced to use 16-bit memory)?

: I just don't see this. To me, it should only be at most a slowdown
: of 100% (i.e. twice as slow). And because of the 68030's cache, the

See, that would only be true IF THE RAM WAS OWNED BY THE CPU. This isn't
16-bit TT ram we're talking about, which _WOULD_ only be 100% or so.

The ST ram is owned, not by the CPU, but by the custom chips. Custom
chips always have first access to ram, and they decide when the CPU can
and cannot have the bus to do its ram work. That's why when you go to
high resolutions and high depths on the Falcon, like on the Amiga, the
custom chips steal cycles that would normally go to the CPU--they have
deterministic access. The custom chips determine who is allowed to use
the bus and when. They also give you a certain amount of time to do what
you want, and you can't keep it any longer than that.

If that wasn't true, you wouldn't have video. That cuts your time
roughly in half again. Both systems suffer this, so again, we only have
to deal with the percent lost between fast and chip ram. You've got to
deal with the extra 100% of being a 16-bit bus.

: What I'm trying to say is that the use of a 16-bit CPU to ST-RAM
: interface, while unfortunate, is not as bad as you guys are making it
: out to be. The Falcon030 is not "crippled" by 400% to 500% like an
: accelerated A500 forced to use only 16-bit ram.

Umm, actually, it's a lot like that. It's a lot like the 500 with an 030
accelerator but without any fast ram (and I do seem to remember that a
few of them did exist). It parallels very well.

: Both the A1200 and Falcon030 have shared RAM. The A1200's CPU has
: 32-bit access to this ram while the Falcon030's CPU only has 16-bit
: access. However...

: The use of a 16-bit CPU to ST-RAM interface only imposes a real
: world slow down of 15% to 30% on the Falcon030. At most, we would
: experience a slow down of around 100%. If I remember correctly,
: even if it had a 32-bit CPU to ST-RAM interface, it still couldn't
: take advantage of the 68030's burst mode since this memory is
: shared.

Correct. The deterministic access of the custom chips has a set limit of how long you can own that bus for, and that means no burst. If it wasn't that way, you'd have chunks of screen where it would be either black or the color would streak-simply because no new graphics data got fetched.

: So, in terms of shared RAM, the A1200 and the Falcon030 are about
: equal in my opinion. The 16-bit bottleneck on the Falcon030 is
: partially offset by the 68030's cache and slightly faster clock speed.

The 020 and the 030 have the same amount of cache when you've got to work out of chip. Data caches become useless, and they've both got 256 bytes. The only advantage the 030 has less is its internal optimizations of the instructions.

: If you want to have the advantages of TT-RAM (FAST-RAM) on the
: Falcon030, you can buy one of the accelerators available from a
: third party. This is similiar to the ability of an A1200 owner to
: later add a DSP to their computer.

: It seems to me that a Falcon030 with TT-RAM (through the use of a
: third party accelerator) isn't that much different from an A1200.

Again, there's the basic design difference between the two that will always separate them. That separation will get bigger, not smaller, as more advanced CPUs enter the design. 16 bits, as I said, is a loss at the 030 level. At the level of the 040, it's a crime, and it'll cost you a lot.

: I don't like the shape of the Return key on the A1200 ;-)). I just
: wish you guys weren't trying so darn hard to put down the Falcon030.

Well, if it helps someone decide on what they want, then it's worth it. I don't like the thought of buying crippled architectures, and I do my best to examine the flaws in a system before I buy it.

As some already know, it's why I bought an A3000T and not an A4000T; the A3000T suits my needs much better, in more than just a few cases.

Now all I need is another 12MB of ram, and I'll be useable. ;)

: Isn't this essentially what the Mac Toolbox is? In my opinion, most
: code on the ST make heavy use of the GEM libraries (Toolbox) too.

There is a rather big difference, though it does sound similar. Actually, in that sense, the Amiga is the same as the Falcon/ST in that respect. However, since I've later been told that the ROM on the Falcon is ALSO 16-bit, the point is moot, and it's still a drag.

Greg

# 1067. Falcon = Amiga 500 + 68030?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-11 20:16:04 UTC
From: cmedley@wam.umd.edu

Ok, I see Gerry and Greg are interested in disputing which is more similar, the Falcon and the Mac LC 2, or the Falcon and an Amiga 500 with a 16mhz 030 accelerator and no FastRAM.

Well, this should be REAL easy to find out. Why not benchmark them using some 68030 assembler code? We can find out how much of a "beating" the Falcon allegedly takes compared to this A500 configuration. If it is really that poor in performance, then let's see it.

I'd suggest that the benchmark should simply be a series of moves between two memory locations accessible by the custom chips, and the systems should be running in a comparable graphics mode, such as 640x400x16 colors (although the A500 would be interlaced in this mode, correct?).

I think since everyone is centering their belief in the superior architecture on speed here, we should start benchmarking. :)

(this will end this argument with a minimum of speculation... hehehehe)

Right!
This is just what i tried to explain those Amiga guys the last three weeks.
But they don't seem to listen.

There is also an additonal notice to your argument:
With the 32bit FastRAM build in your Amiga your CPU has not to share the
access with other components like Video, Blitter, DMA (because they can only
access with 16bit). Now try to run an application only with FastRAM...
You will need the slower shared RAM even in the Amiga 1200.

I strongly disagree. There's no way an A500 with a 16Mhz 68030
accelerator and no FAST-RAM is as fast as a stock Falcon030. You are
forgetting one very important point.

The interface to CHIP-RAM on the A500 is designed for a 7.16Mhz 68000.

The interface to the ST-RAM on the Falcon030 is designed for, at
_worst_, a 16Mhz 68000. In other words, the bus speed on the Falcon030
is "twice as fast" as the one in the A500 so I wouldn't expect it to
suffer a 400% to 500% performance degradation like the A500.

In fact, I still believe it's at most a 100% degradation. If Atari
could magically increase the Falcon030's data bus to 32-bits instead
of 16-bits, I would only expect a performance boost of, at most, 100%.
This seems so logical to me!

Are you saying that if Atari magically increases the Falcon030's data
bus to 32-bits we would see a 400% to 500% increase in speed? How
would that occur? You still couldn't take advantage of burst mode
since ST-RAM is shared.

The main point that I'm trying to make is that the Falcon030 has a
completely different memory implementation than the original ST. You
can't compare it with an accelerated A500 or ST.

By the way, something interesting can be seen when comparing the
Falcon030 to the TT030. The TT030 has a 64-bit wide ST-RAM and
allows its 32Mhz 68030 32-bit access to it.

The Falcon030 has a 32-bit wide ST-RAM and allows its 16Mhz 68030 16-bit
access to it.

And yet, the TT030 doesn't have the bandwidth to support a 640x480 256
color VGA mode while the Falcon030 does!
